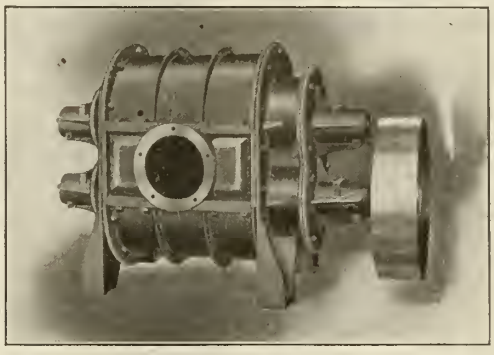
THE PRITCHARD-ANDREWS COMPANY, LIMITED

OTTAWA



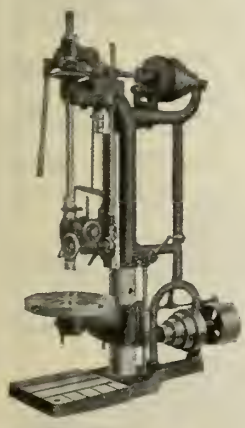
GENERAL ENGRAVERS

Steel, Rubber and Brass Stamp Makers. Dies and Companies' Seals.

BLOWERS

ROTARY POSITIVE PRESSURE TYPE

Weighs less and occupies less space for the same displacement per revolution than any other two-impeller blower.



LET US KNOW YOUR REQUIREMENTS

CORRESPONDENCE A PLEASURE

Sherbrooke Machinery Co., LIMITED

SHERBROOKE, QUE.

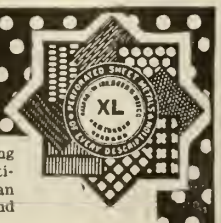
BLOWER DEPT.

Let This

"Mechanic's Drill"

solve your drilling problems for you. It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.



Write for our new catalog.

Rockford Machine Tool Co.

Rockford - Illinois

Mfrs. of the Rockford Planer and Shaper

PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

Canada Wire & Iron Goods Co., Hamilton

We also manufacture

- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

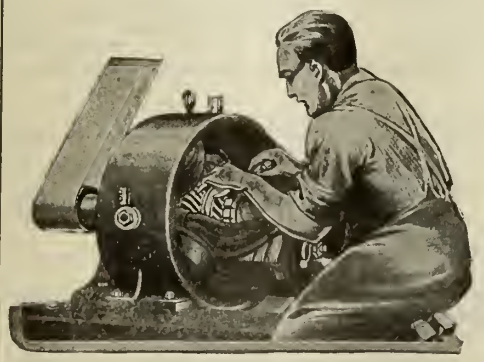
Asa S. Cook Co.



Hartford, Conn.

We manufacture Rivets of every description, ½ inch dia. and smaller.

PARMENTER & BULLOCH CO., LTD.

GANANOQUE, ONT.

We Specialize in ELECTRICAL REPAIRS

The experience we have gained by repairing the machines of all makers, all sizes, all voltages, and currents is rarely secured by the manufacturer. If he makes your repairs it **may** be as good as before, **but no better.** When we tackle a job it is our aim to make the weak part stronger than the original—and we invariably do it.

A Job Well Done is an Ad. for Ever

Who Wants Your Order?

¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

The advertiser would like to know where you saw his advertisement—tell him.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

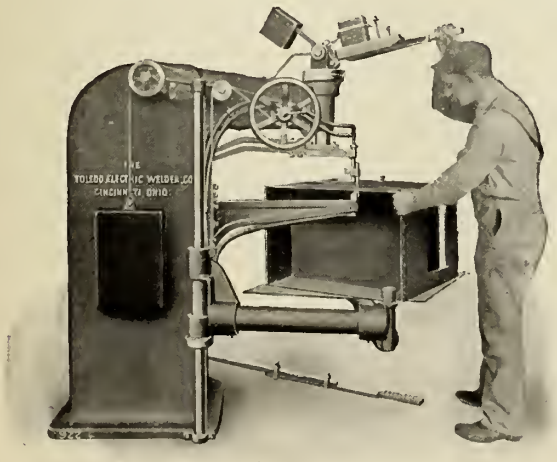
"BUTTERFIELD"

Taps, Dies, Reamers and Screw Plates

We Guarantee Our Tools To Be Efficient And Economical

We welcome comparative lists because we know that our tools will prove their superiority.

"Butterfield" Tools must be absolutely accurate before they leave our plant.



Give them a trial—they'll save you money in every day of service.

BUTTERFIELD & CO.

ROCK ISLAND, QUE. DERBY LINE, VT.

Cut Your Riveting Costs With a "TOLEDO" WELDER

No. 150 Welder

This type of machine has been a genuine money-maker for stove manufacturers. The old-time method of riveting steel range bodies, stove runners, etc., has been replaced by "TOLEDO" electric welders in the largest plants throughout the country. A "TOLEDO" welder means a stronger, better and neater job at less than a third of the old cost.

Let us ship you a machine on our free trial plan—then judge for yourself.

Just out—new Bulletins Nos. 14 and 15. Write for them.

NO LEASE. NO LICENSE.

NO ROYALTY.

THE TOLEDO ELECTRIC WELDER COMPANY

CUMMINSVILLE, CINCINNATI, OHIO

They Never Wear Out

¼ to 20-ton Capacities.

THE READING MULTIPLE GEAR CHAIN BLOCK

Obtains its power through a train of spur gearing, which operates the main chain sheave, located between the two central frames of the block.

Efficiency eighty per cent. Hoists freely and rapidly.

Is put together as carefully as a watch, with every detail for hard service considered. All working parts are protected by an oil-tight, dust-proof case, which holds oil sufficient for six months' lubrication.

Where the Side-Head Boring Mill Is Different

Some of the new features that give increased accuracy, greater convenience to operator and higher production.

Independent Side Head

Side Head is entirely independent of cross rail and can be lowered below table

Side-Head Rapid Traverse

Power Rapid Traverse in either direction is provided for side head as well as vertical head.

Half-Indexing of Vertical Turret

Turret has five tool holders and ten indexing positions. —that is, tools can be indexed halfway between the five usual positions. This feature has proved very valuable on certain classes of work.

Convenient Location of Speed Control

The two speed control levers are located directly below the table, so that operator can instantly obtain desired speed while standing facing his work.

CAPACITY

Swings with side head in position—38 inches, with side head down—44 inches. Maximum from table top to under side of cross rail—26 inches, to turret face—38 inches. Vertical head travels 28 inches vertically. Side Head travels and will turn 26 inches vertically.

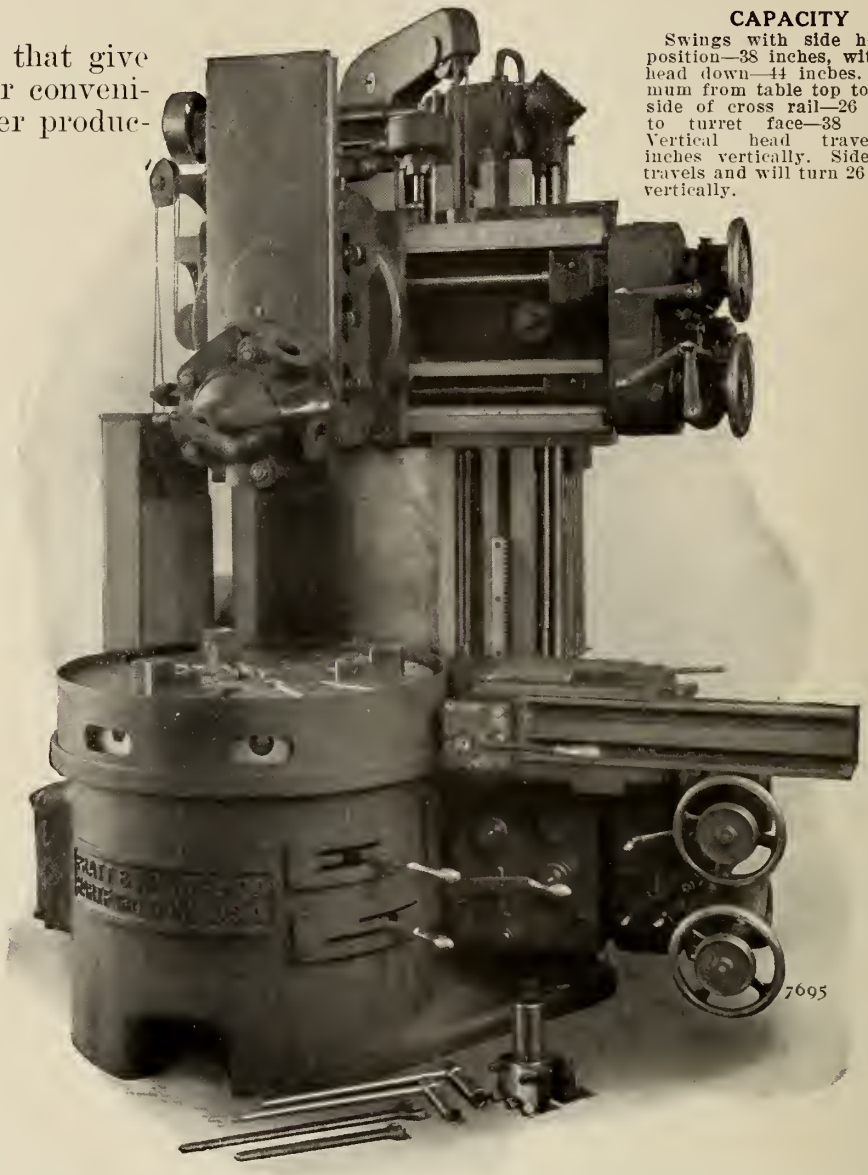

Table starting and stopping lever operates vertically, making it impossible to start machine accidentally. After releasing this lever, from its upper or starting position, it drops by its weight and the table brake is automatically engaged.

Duplicate Lever System

The location and action of the levers for controlling the feed and rapid power traverse is exactly the same on both the crossrail and side head. The operating value of this feature is readily seen.

In engaging feed and fast traverse levers are advanced in direction in which member is to travel.

Extensive Flood Lubrication

Flood lubrication is most extensively used, all feed units, table drive and cross rail elevating mechanisms, as well as spindle bearings, have ample and continuous supply of oil.

Write for new circular "Side-Head Boring Mill."

Whichever way you use it—

as a hard-gripping, non-slipping pipe wrench; as an efficient, dependable nut wrench; as both on the same job, or as either, singly—the

"Bemis & Call" Combination Wrench

is always ready for the work, always capable of standing up and holding its own with the most obstinate piece of pipe or the rustiest nut.

Its forged steel construction insures you against breakage; its case-hardened jaws ensure its keeping parallel; the long nut facilitates adjustment, and the interchangeable plan under which it is made makes renewals easy.

Get the catalog—it's worth it.

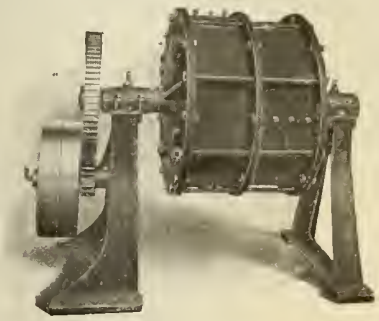
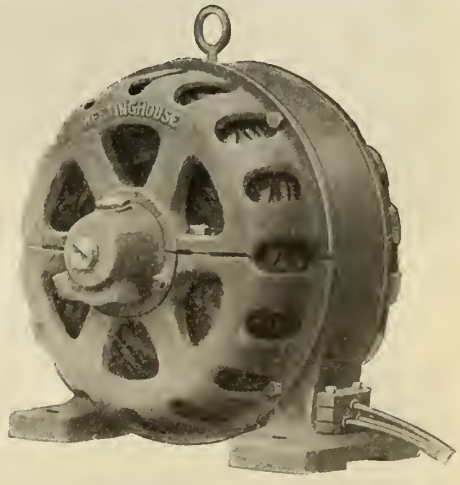
The Abbott Way



is the logical way to finish all your small parts.

Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.



If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

The Abbott Ball Company
1047 Elmwood Avenue **Hartford, Conn.**

There are thousands of horsepower of Westinghouse Type CCL Induction Motors successfully driving all kinds of machinery.

Westinghouse Type CCL Induction Motor

MANY of them have been in continuous service for years and are still as good as ever.

Their popularity is the result of the good service they give the user—He finds his power bills low; his motor attendance and maintenance expense almost nothing; and his machines always ready to operate whenever wanted.

Westinghouse Type CCL Motors are supplied for driving any size and type of machine from any commercial alternating-current circuit.

Ask our nearest office to give you full particulars.

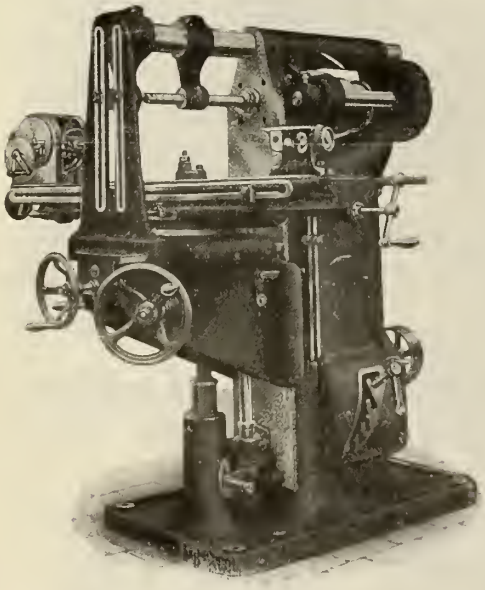
A "BB" Board Lift Drop Hammer

Installed in your Factory means a

LIFT IN PROFITS and a DROP IN COST.

WHY?

Because:-1st. They are Built to stand the severest class of work.
2nd. They are Efficient.
3rd. They are Simple in construction.
4th. They Turn the work out quickly and accurately.



Our 300-Pound Drop Hammer with Four Poppet Anvil illustrated, is equipped with roller friction geared lift, which because of its effectiveness in giving the closest possible approach to the full falling weight of the hammer is acknowledged to be the most efficient in use. We furnish these hammers with dove-tail, recess or poppet anvil, as desired. The hammer can be instantly stopped or made to descend as slowly as may be desired, by releasing the foot treadle or by depressing it lightly. It is only necessary to keep the treadle depressed if continuous blows are wanted. The hammer, shoes and gears are made of steel. We can furnish Drop Hammers up to 1,000 pounds.

NORTON

Loading in cylindrical grinding is frequently caused by running a wheel too slow, especially when crowding a hard wheel. At slow speed with plenty of power the grains would withstand this crowding without breaking away.

The way to overcome this is to use not only

NORTON GRINDING WHEELS

Alundum for Steel **Crystolon for Cast Iron**

at the proper speed but also to call freely upon such grinding facts as our experience has enabled us to collect.

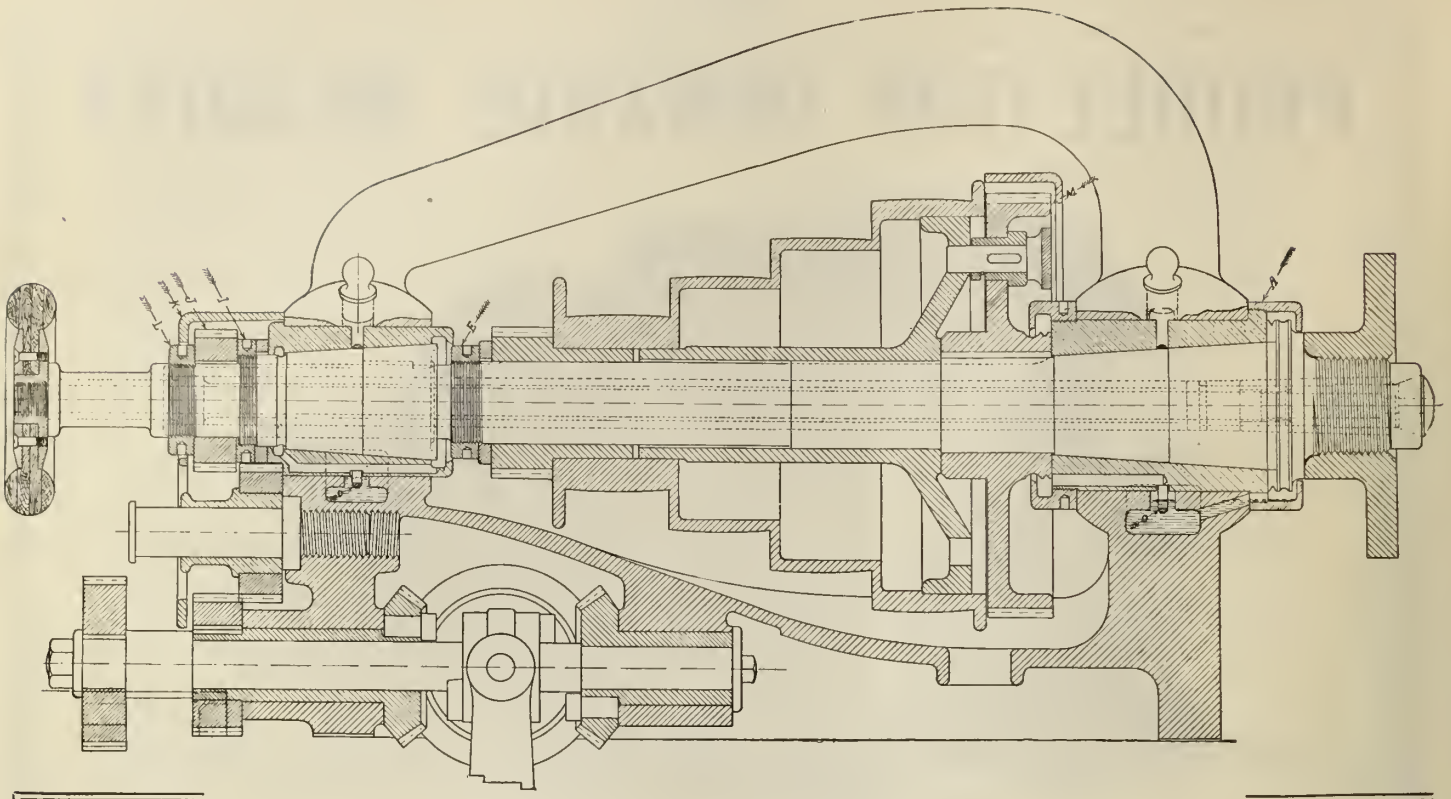
PRODUCTION DEMANDS RIGIDITY

The Cincinnati "full capacity" Head is commensurate with our heavy Universal Machines.

The swivel block can't move under cut. The wide clamps *grip through 360°* on 8½ in. diameter trunnions.

600 pounds—22″ from centre.
Test of rigidity of clamps.

The 3½ in. spindle is solidly locked by a self-aligning clamp.



All other dimensions being in proportion insure maintenance of original high degree of accuracy.

Catalog "Tool Room Data" gives complete details.

The CINCINNATI MILLING MACHINE COMPANY

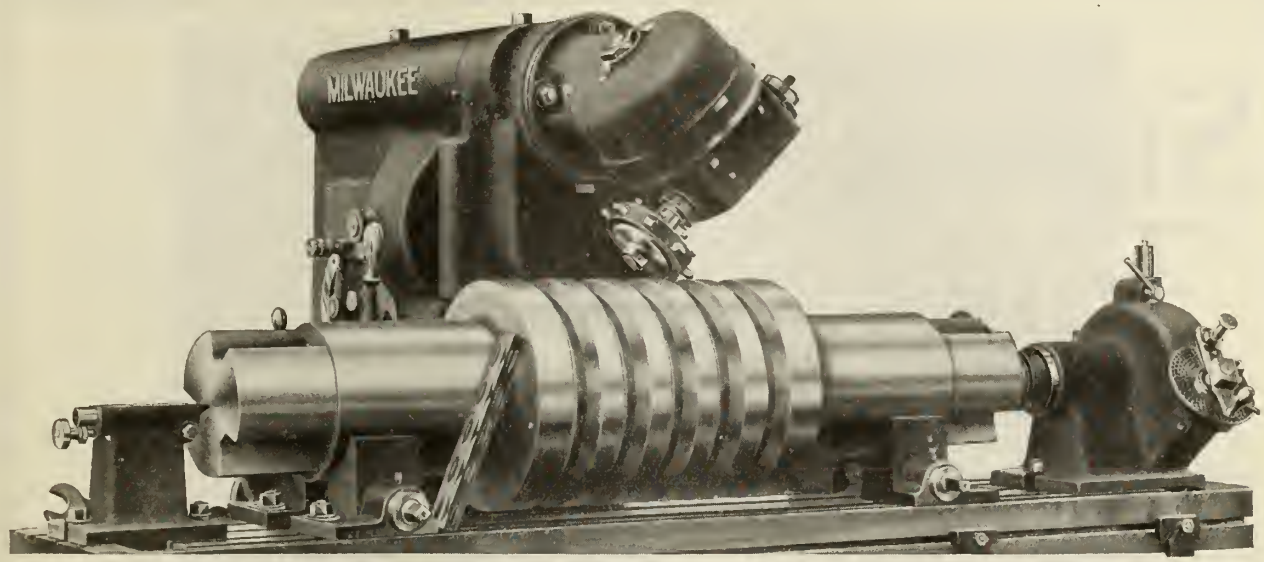
CINCINNATI, OHIO, U. S. A.

Canadian Agents: H. W. PETRIE, Limited, TORONTO, MONTREAL. TAYLOR & YOUNG, VANCOUVER.

Tie Bar Headstocks of Hendey Lathes

Why do we use the tie bar? To support the front bearing housing, which it does by bracing it from the rear housing. What does it accomplish? It prevents backward deflection of housing from heavy end thrust, which if set up, would throw the housing out of alignment and so cause spindle to bind and run hard. The tie bar, by uniting the housings at the top, secures a continuous casting surrounding spindle bearings, both top and bottom, giving the maximum of rigidity necessary to support spindle under heaviest cuts with freedom from chatter.

Other improved features of these heads are the spindle bearings and their oiling facilities. Bearings have unusual length, coupled with large average diameter. All thrust is taken at the front bearing. This is distributed over the face of bearing and taper seat, which surfaces are so proportioned as to make for practically permanent adjustment when once it is established.



Both bearings are oiled by cascade method through oiling rings which revolve with spindle and run through oil-filled reservoirs underneath bearings, pumping a continuous stream of oil to top of bearing, after which it is freely distributed over the entire surface of bearing and then returned to reservoir. These reservoirs have drain-out plugs so that bearings can easily be washed and reservoirs refilled at any time desired.

Overhanging collars at both ends of front bearing make same practically dustproof. This type of head furnished with all sizes of lathes 12″ to 24″ swing inclusive.

Milling a Chilled Cast Iron Roll used for Rolling Concrete Reinforcing Bars

The great growth of concrete construction has necessitated an increased production of rolls used for turning out bars of steel of various form other than perfectly symmetrical from end to end.

There is no better way of giving these rolls the proper forms and the ability to stand up well under such severe service than by machining them on a first-class, modern milling machine.

A small section of the particular bar in question is shown leaning against the roll. To produce this bar it is necessary to mill the roll on both the V-sides and also in the bottom.

The work is done on a Milwaukee No. 3B Plain Miller with Universal Milling Attachment. The spindle of the attachment is set in a horizontal position for the bottom and at 45 degrees in both directions for the sides. The attachment can be set at any angle by reason of the two swivel planes at right angles to each other.

The roll is held by a pair of Plain Centres and, as it is extremely heavy, is also supported by special adjustable V-blocks.

The rate at which this work can be done, even on chilled iron, is a surprise to those who have it to do or have seen it done.

The job illustrates another one of the many uses of the Universal Milling Attachment in the machine shop. The Universal Milling Attachment for Milwaukee Millers differs principally from others in that it is unusually heavy and rigid.

This construction adapts it to more than very light work and enables it to withstand severe and constant usage. Not only is it suited to meet the occasional and unusual job but it may also be used to advantage on day-to-day work.

By extending the dove tail on the column up above the spindle we give to our attachments such as this a rigidity practically as great as though they were integral with the column. The job shown above is certainly a good test.

The claims of Milwaukee Millers to recognition as first-class modern milling machines are many and important.

All gears are of hardened steel. All gears and bearings are continuously flushed and cooled by our patented cascade lubricating system. The drive on all our machines is of the constant speed type which eliminates the faults of the cone pulley drive and gives a pull at the periphery of the cutter that is the same at any given surface speed regardless of cutter diameter. Knee is one-piece, box type, with solid top and offers minimum opportunity for distortion. The column is of deep, heavy, box section, strongly ribbed.

These and other Milwaukee features and details of mechanical excellence are fully described in our Bulletins. If you have not your copies, it will be to your advantage to write for them. Nobody who has to do with machinery can afford not to know about Milwaukee Millers.

Our experience as expert and practical milling machinists is at your disposal to help you solve any problem connected with milling work.

Starrett Tools

are used by the men who strive for greater efficiency

The use of a Starrett Surface Gage and Combination Square by the man at the planer below is a good example of efficiency in measuring.

Accuracy is insured because they are Starrett tools, while speed and wide range of usefulness are obtained because all Starrett Tools are designed to give just that service.

The Surface Gage may be set at the proper height by sliding the blade of the square to the desired position and bringing the scriber into contact with the top of the blade.

You men with up-to-date ideas on shop management, know how much can be saved by watching the little motions and operations. You realize that a few seconds saved by each man on a single operation makes a large total.

Let Starrett tools help save those seconds.

Send for our big, new, free catalog 203, describing the full line of Starrett Tools and Hack Saws.

Magic Chuck Equipment

Have you ever considered how much time is lost inserting and releasing drills, when you use an ordinary drill chuck? The MAGIC CHUCK prevents this waste, because drills, reamers or taps are instantly inserted and released without stopping the spindle of your machine.

Send for our Bulletin 31—then place your order for a MAGIC CHUCK EQUIPMENT and be convinced of its worth.

Raise ring with thumb; collet and drill drops into hand

The MAGIC CHUCK is the correct Chuck to use in the manufacture of automobiles and automobile parts, and has been adopted by many concerns as the standard in a quick-change chuck.

We guarantee definite results and are prepared to demonstrate the advantages of the MAGIC CHUCK on your own work and in your own shops, if you will say the word.

The two great features necessary in a manufacturing proposition, accuracy in the finished product and economy in operation, are embodied in our MAGIC CHUCKS.

By a simple device, our GA Collets, you can reclaim all your broken tang drills. No need to turn the shanks down, or grind a flat on the remaining portion of the shank—because the tang has been twisted off, simply specify on your order GA Collets for broken tang drills, Morse Taper No. —, and you use up the drill instead of discarding it.

Send for Bulletin No. 31.

Taper-Pin Reamers

Spiral Fluted

Magnified View

A *straight* fluted reamer is very apt to chatter. If it once starts to chatter nothing can stop it. Here's what you get.

Magnified View

A *spiral* fluted reamer cannot chatter, if the spiral is left-hand. Green River Spiral Fluted Reamers always produce this.

The duty of a Taper-Pin Reamer

is to size the hole, draw the walls to the exact taper of the pin, and smooth (really polish) the surface.

Green River Taper-Pin Reamers do their full duty.

Do you want a list of reasons why?
Write for our spiral flute argument.

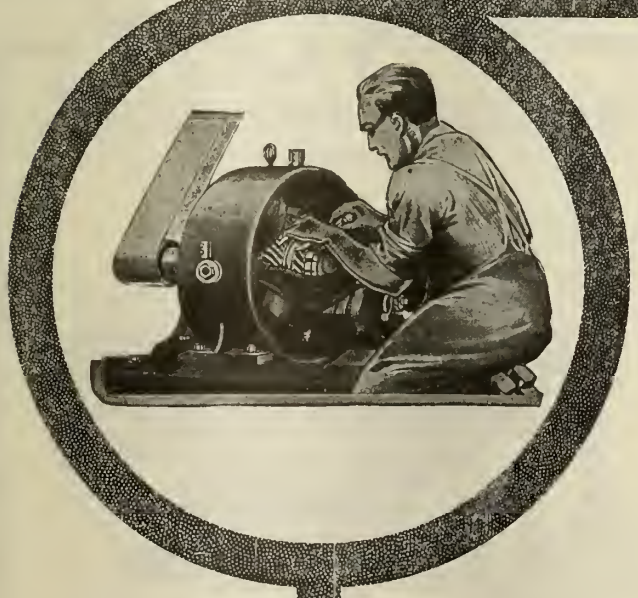
PRACTICAL BOOKS FOR PRACTICAL MEN



These books were written especially for practical self-instruction, by experts whose experience and standing make them authorities.

They are so clear that the beginner can understand them; so thorough that the trained worker can learn from them; so practical that they will give any man a working knowledge of the subjects that they treat, and save him both time and money.

They not only cover the fundamental principles of mechanical science, engineering practice, and business usage, but also present the latest developments and the accepted practice of the most successful men, in those lines.

They give men a practical knowledge of practical things, which enables them to think more accurately and to work more efficiently; and they compose the most helpful, reliable, and comprehensive series of home study books ever put upon the market.

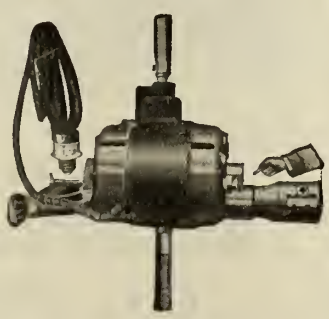
U. S. Electric Drills and Grinders

Save Time, Labor and Money



They can be attached to any lamp socket. For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.
3-16 inch, W.G.T. 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts. Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

A Canadian Quality Product for Canadians Who Want Efficiency

We couldn't serve our Canadian customers to the best advantage from across the line, so—

We built a modern, carefully laid-out plant in Hamilton—

Equipped it with the most modern machinery, and all the special patented devices we had evolved in our U.S. plant—

Added several new improvements—

Sent Canadian expert mechanics to our Springfield, Mass., factory for special education in the making of VICTORS—

And then went ahead to make

VICTOR Hack Saws

better than they had ever been made before.

We offer you a Canadian product made in a Canadian factory by Canadian workmen—

A quality hack saw—VICTOR Flexible for hand frames, VICTOR All-Hards for power use (and also all-hards for hand frames for those who prefer them)—that will do more work, and do it easier, with less trouble and less breakage than any hack saw on the Canadian market.

A "large" statement, but the VICTOR will make good on it if you give it a fair trial.

"Get a box and try 'em." Remember, there's a VICTOR for every purpose. This does not mean a confusing number of blades—simply a scientific solution of your hack saw troubles.

If you are up against it on any of your work, look for the VICTOR sign at your dealer's or write us direct.

Asbestos Lubricants That Kill Heat

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly-moving parts are to be satisfactorily lubricated, this cannot be equalled.

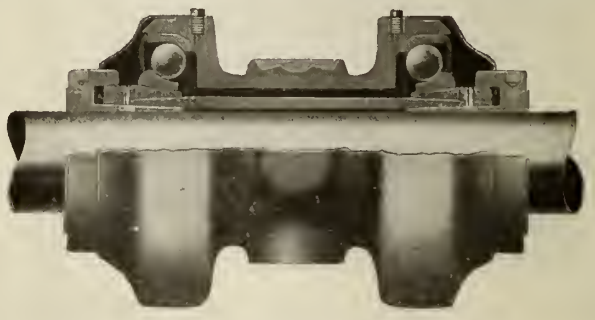
AXOLENE

Is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

ASBESTOS LUBRICATION IS THE COMING ELIMINATOR OF BEARING TROUBLES.

The Railway Asbestos Packing Co., Ltd.

Home Office and Factory: Sherbrooke, P.Q. Montreal, 30 St. Francois Xavier St.



YOU CAN INCREASE YOUR POWER WITHOUT INCREASING THE SIZE OF YOUR POWER PLANT

Your present line shafting is consuming from 15% to 60% of your power.

The Chapman Double Ball Bearings will save this waste and turn it into productive energy.

They will also reduce your oiling and attention to a minimum.

They fit any adjustable hanger and the change can be made with but little delay to you.

In use in over 2,000 Canadian Factories

We carry in stock the best grade of Steel Balls.

As Permanent As A Roof Cut Out of Solid Rock

Can you imagine anything more durable than a roof cut out of solid rock? Such a roof would be practically *indestructible*. Fire couldn't burn it. Acid fumes, gases, rain, snow, sun and extreme temperatures couldn't injure it. A roof of this description—a roof that is cut from solid rock to all intents and purposes—is

J-M Asbestos Roofing

This roofing is made by crushing solid Asbestos Rock and compressing the long fibres into a dense, homogeneous felt. Several layers of this rock felt are then permanently cemented together with Nature's greatest water-proofer, Trinidad Lake Asphalt, making a light-weight roofing that is virtually a *solid sheet of pliable stone.*

J-M Asbestos Roofing forever rids you from the expense of repairs. *No coating. No graveling. Everlasting.* After more than a quarter-century of service J-M Asbestos Roofing shows no signs of deterioration. It is the cheapest of all roofings from the cost-per-year standpoint. Adapted to any building and any climate. Easily and quickly applied. If your dealer can't supply you, we will ship direct. **Write nearest branch for sample of the Asbestos Rock from which this roofing is made, and illustrated catalog.**

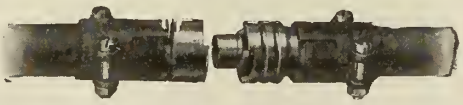
CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS



For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock :—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

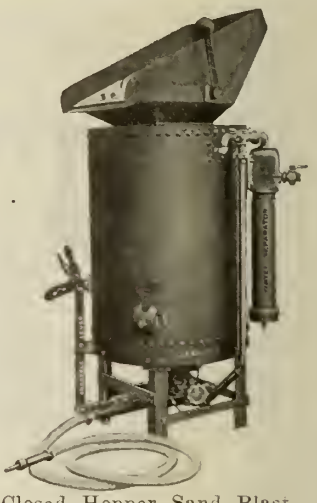
Vital Factors in Profitable Casting Cleaning

A Good Sand Blast and Cheap Air

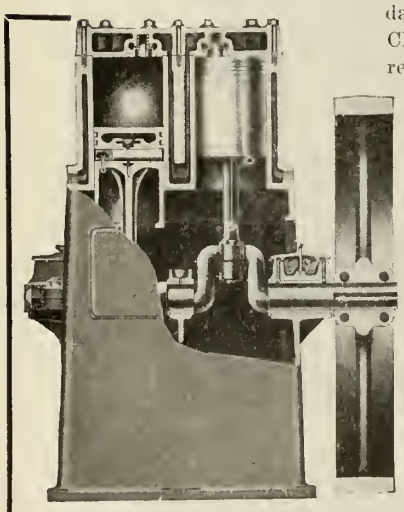
Curtis Sand Blasts

Have many features that make them superior.



For instance—Sand screened and Hopper filled at one operation.

LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.



HANDY THROTTLE CONTROL that saves time, air and sand.

WATER SEPARATOR that means fewer chokes due to damp sand.

CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.

Closed Hopper Sand Blast

GREATER CUTTING ACTION, due design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?

CHEAP AIR.

Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operating and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness) they operate earlier and require less attention than any other type.

MAGNOLIA FIXED IT

East Boston, Mass., May 17th, 1912.

Gentlemen:—While Engineer of the Union Grain Elevator Company in Boston in 1891, I had opportunity of using about 100 pounds of your MAGNOLIA BABBITT METAL on a bearing of a vertical shaft, which transmitted power to three 4-foot circular grist mills which ground corn and oats into meal, and which I knew to be very hard work.

One day while all three mills were being used for grinding corn, the bearing of the vertical shaft became heated, causing the babbitt in the rear of the box to become loose and revolve around half turn under the cap, bringing all the strain on lower step located in cellar of building, which was 25 feet below. This step, so to speak, was contained in a box of oil two inches deep, the strain being so excessive after the babbitt became disengaged, that this oil in the step reached the boiling point, which notified me that something was wrong. I immediately investigated and located the trouble. I reported same to the superintendent, requesting an immediate shut-down, which I did. He inquired of me if I could repair the damage myself (having a number of rush orders on hand), and I told him I certainly could, providing he would get me the required quantity of MAGNOLIA BABBITT METAL, which he did.

After removing all the old and inferior babbitt from the box, I re-babbitted it with your babbitt and adjusted the box in place. The shaft has run as 'cool as a cucumber' (as the saying is), not giving the slightest indication of heating, and gave the best of satisfaction.

I heartily recommend MAGNOLIA METAL to all requiring a reliable and substantial job.

Wishing you every success, I remain

Yours truly,

J. H. Clemens,
211 Maverick St.,
East Boston, Mass.

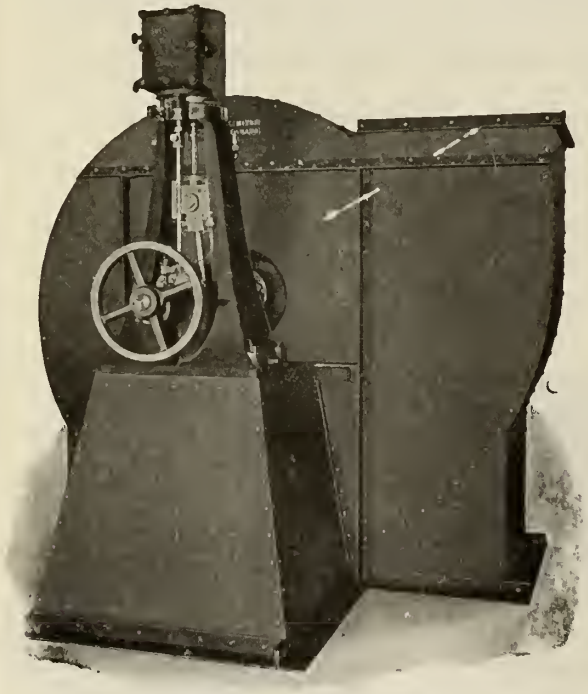
Start It Running

Keep It Running



There's no lost motion and no waste time with a Globe Tumbling Barrel. Every minute is economized. You can start it running the first thing in the morning and keep it running until the whistle blows, if necessary, without once having to stop it to inspect the work, fill or empty it.

GLOBE TUMBLING BARRELS

will give you better tumbling in less time and at less cost than the ordinary barrel. And you can use it for either gentle or violent tumbling by simply changing the angle at which the barrel is running.

Globe Barrels are made in eight stock sizes, list price from $50 to $170. If you want to know how the Globe Barrel will help you, write for Catalogue 2, which tells about its many advantages.

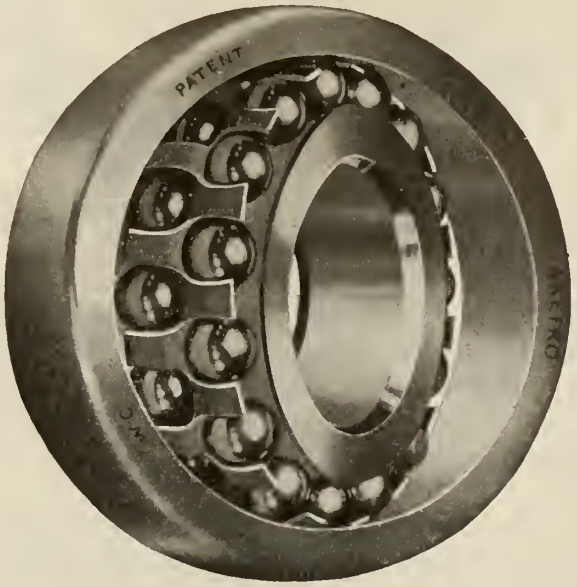
Take Time to Read Your Paper

¶ Occasionally we meet a man who says "Oh, I haven't time to read trade papers! I'm too busy."

¶ He is typical of his class, and his class is growing smaller every year. He belongs to the betwixt and between variety, neither very large nor very small. His business is large enough to keep him at detail yet not big enough to permit of his hiring help to relieve him of petty duties.

¶ We refer to the owner or manager of a business which is just at the stage when it needs all the help and brains that can be given it. If the ideas that are constantly being supplied in "Canadian Machinery" were applied to the small but growing business, as well as to the large and well-organized industry, results would be amazing.



¶ Reading a trade paper, if a good one, should be one of a business man's first duties. Let him discharge that and the other claims upon his time will grow fewer in number and greater in importance.

¶ One of the most successful of the young men we know looks through "Canadian Machinery" from cover to cover every week. He glances through the editorial section, selects any article that may be applicable to his business, reads the Industrial and Construction News Markets and special features. Then he starts at the front and reads the advertisements.

¶ His business is well organized, and everything moves like clockwork. He always has time to listen to a good proposition and he is a consistent and liberal advertiser himself.

¶ Take a half-hitch in your time for a few weeks and read your paper thoroughly if you haven't been doing so. It will only take you a few minutes each day, and results will be surprising.

¶ Fall into line with the big body of successful men who are keeping in close touch with changing conditions, improved methods, and new machinery.

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Place and Part of Snap Flask, Plate and Machine Moulding*

By A. R. Bartlett

The relative positions occupied by the above moulding systems in modern foundry practice are discussed in this article, and while it may not be said that the various details given smack of anything actually new, the different practical considerations brought under review indicate how widespread in extent and studious in application, is the foundry development movement.

MOULDING in snap-flasks is a much older practice than machine moulding, and is very extensively used in the United States, where the wooden box in all shapes and sizes is widely adopted. Snap-flasks are not of great value where heavy work has to be done, nor yet where there is not sufficient repetition work to pay for the making of pattern plates. Any light work can be made in snap-flasks, but the usual practice is not to use them for general jobbing work, though their use saves floor space for storing boxes and also the cost of supplying the usual moulding box. The life of the snap-flask is considerable, as they are always made of hard wood, and as they should never be left on the floor, but hung up after using, they are not liable to get burnt or damaged.

Snap-Flask Advantages.

In producing small castings in snap-flasks, either on the moulding machine or with plate moulding, a great deal of time and floor space is saved. Time is saved by having to handle only one pair of boxes, therefore not having to travel backwards and forwards from the stack of moulding boxes, as when ramming up in permanent boxes. The moulder rams first the bottom part, then the top part, loosens the pattern, lifts the top from the plate, then the plate from the bottom, assembles this mould, puts it in place on the pouring floor, releases the snaps, and returns with the empty boxes to repeat the operation. He has thus only to travel

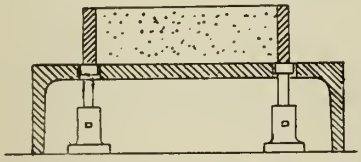

FIG. 1. PATTERN DRAWING ARRANGEMENT FOR HEAVY MOULDS.

from the pouring floor to the plate, or machine, whichever he is engaged upon, with his empty snap-flask. Time is also saved in not having to stack the empty boxes when the castings are taken from the sand. Floor space is also saved, especially where machine moulding is done, for the reason that room is not required to stack the large number of boxes wanted in the ordinary way of machine moulding.

We have done a considerable amount of snap-flask work by apprentices with plates before the present moulding machines were installed, and the number of machines having now been increased, it is found much more economical to utilize for machine moulding the pattern plates the apprentices used with the snap-flasks, by having the plates drilled for bolting to the machine table and to fit the machine box pins. However, when the machines are busy we can always fall back

FIG. 2. RAPPING PIECE.

on the snap-flasks. The pattern plates when used on the machine will have a longer life, as invariably the machines have a mechanical vibrator; if used for hand moulding, the plate gets distorted by the continual rapping and is liable to get broken by careless hammering.

The Work Feature.

Snap-flask moulding, as a general rule, must be confined to shallow work, on account of the risk of the mould bursting when poured, through having no supporting box. Deeper work can be made by banking sand against the sides and in between the closed moulds, or by placing the moulds in a trench and filling in around them. As a matter of course, all work made in snap-flasks must be weighted before pouring, and the usual way is to place a plate on the top of the closed mould, having a hole in it where the runner is located. The moulds could be clamped, but it would then be necessary to have plates on the bottom to match those on the top.

Multiple Moulding.

Multiple moulding is often done in snap-flasks, and then it is usual to clamp the work before pouring, but this work must of necessity be of a very shallow nature, and must not be very close to the outside of the mould, nor yet can it be carried very high, on account of the strain put upon the bottom mould. In placing the moulds one on the other, a plate is placed under the bottom box, a pin passing from the plate through the lug of the boxes to top plate, the top plate on the first mould acting as the plate of the second mould, and so on. The height to which the work can be carried is, of course, decided by its nature, and the heat of the metal. In some foundries it is the practice to use loose iron frames inside the snap-flask to withstand the pressure, and then, of course, the height of the multiple moulds may be increased to whatever is practical for running purposes, and heavier work can be made as well. Any light work that can be made in a two-part box can be made in the snap-flask, providing proper care is taken and the pattern plates and boxes are in good condition.

Snap-Flask Pattern Plates.

The usual method of making pattern plates for snap-flask work is to mould the patterns in a box large enough to make the plate about 1 in. larger each way than the snap-flask to be used, this extra size being to insure the moulder being able to rap the pattern plate without striking the box and loosening the mould. After the master patterns have been moulded in the correct positions to suit the snap-flask and the runners have been cut as they will be required on the plate to run the work when moulding is the snap-flask, a frame, the thickness and size of the plate required, is placed on the joint and the sand then made up round it, this forming the joint for the top to rest upon. It is the practice in some foundries to place an iron frame on the joint to form the plate, this doing away with the labor of making up the mould for the plate; but if the pattern

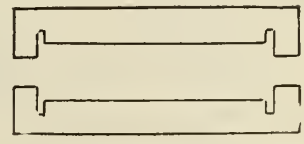

FIG. 3. STRIPPING PLATE FOR PIPE MOULD.

plate is made of cast-iron this is not advisable, as the edges of the plate are chilled, and are liable to get broken when loosening of the pattern takes place.

Moulding Machine Comparison.

I do not consider the snap-flask to be of any value if a machine can be installed instead, for any mould that can be made from a plate in a snap-flask can be made on a moulding machine much

*From a paper read recently before the London branch of the British Foundrymen's Association.

quicker; and, in the case of the pattern having a flat surface, even if only one or two castings are wanted off, no matter whether it is cast flat side up or down, it can be placed loose on the moulding machine table and rammed much more evenly by the press-head than by hand in the snap-flask. Also, there is always the opportunity, with a machine table with holes in it, of screwing down the pattern, thus getting the benefit of an ac-

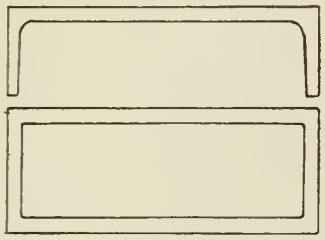

FIG 4. SIDE ELEVATION AND PLAN OF FRAME.

curate draw; it is invariably found that the hand-drawn pattern moulded in the snap-flask leaves the mould in such a condition that patching is necessary.

Plate Moulding.

Plate moulding is the first step from general jobbing moulding to machine moulding; but it needs a greater knowledge of foundry practice than the average machine moulder possesses. It is, accordingly, necessary to have skilled labor on it in a large number of cases. It can be done with small plates as in the snap-flask, or it can be enlarged upon to a very great extent, as in the manufacture of piano frames, filter press plates of a large size, fly-wheels, etc.

Plate moulding does not lend itself to work of a deep description, as the usual method of lifting the moulding box from the pattern plate with large work is by the crane, and a good lift is not always managed by the sudden jerk of the crane,

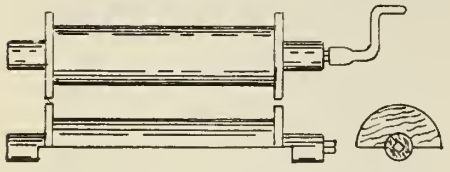

FIG. 5. PLAN, SIDE ELEVATION AND END VIEW OF PIPE PATTERN.

no matter how carefully the box is steadied off. One method employed in lifting heavy boxes off the pattern plate is to use three or four small screw jacks. These are placed on solid foundations under the plate, and a hole is made in the plate to receive the head of the jack directly under the moulding box. When the box is ready for lifting, the jacks are operated so that the box lifts steadily from the plate, and a good lift is certain if all the jacks are worked in unison. (see Fig. 1).

The usual method of vibrating the pattern is by striking a block of wood, held against the plate, with a hammer; but a great improvement on this and in the result obtained, is to bolt a bar of mild steel of the shape shown in Fig. 2 against the side of the plate and strike on the bar in the middle of the bow. This has a springing effect and saves the direct blow on the plate and the possible distortion and damage caused thereby. The size of the bar would be decided by the size of the plate and the amount of loosening necessary to insure a good lift.

In moulding a casting having both sides alike, it is only necessary to have a half-pattern, the bottom part being rammed and placed on the floor and the top part rammed and the mould closed. This method applies particularly to fly-wheels and castings similar to filter press plates. Some of the latter castings are a type of corrugated plate, having a large number of parallel ridges about a quarter of an inch high in sections, some running horizontally and some vertically across the plate. Some are studded all over with small cubes resembling hobnails. Since there is no vibration during the actual lifting of the moulding box as in machine moulding, it is absolutely necessary that a good tough facing sand be used to insure a good life, and so avoid the necessity of mending the broken parts entailed by a bad lift.

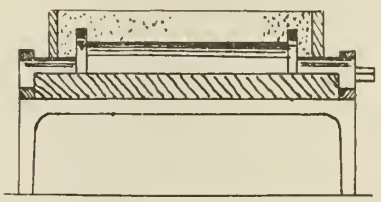

FIG. 6. SIDE AND END ELEVATIONS OF PIPE MOULDING ARRANGEMENT.

Plate Moulding Pipes.

Another type of work done on plates is the making of pipes, spindles, or any description of round casting. Any of these moulds lift clean and perfect from half-patterns fixed to a plate, and if flanges are used on them they can be worked loose and drawn out after the mould is lifted. The same applies to any lug or boss that can be dovetailed or pinned until the ramming is done, the pins being then withdrawn so that the loose pieces lift with the mould.

This idea has been improved upon by having the half-pattern made in iron and revolving in a bearing, so that when the mould is rammed and ready for lifting, the half-pattern is turned by a handle from the outside of the plate (see Figs 3 to 6). The plate itself is made as shown in Fig. 3 when for a pipe, the hole in it being the exact size of the casting required. A frame is made for the plate to stand upon, the latter being bolted on so that another can take its place when required. The frame (Fig. 4) remains stationary. The pattern itself is made as shown in Fig. 5. It is held in its place by a cap placed outside the box, and the end extending beyond the plate is made square to receive the handle.

When the mould is rammed, the pattern can be turned clear, making it impossible to get a bad lift, as there is only a flat surface to lift from, and a reasonable quantity of parting material will avoid any sticking of the sand. Only unskilled labor is employed ramming this type of work, but it is expedient to employ skilled labor to core and close the moulds. No tooling of the mould is necessary, as the turning of the polished pattern sleeks the mould, thus doing away with the moulders' tools, and saving a great amount of time.

Plate Moulding Sheaves.

Certain types of sheaves can be made on the same principle, also worms if a screw be placed in the bearing to correspond with the screw on the pattern. A practical man can adapt this method of moulding to a great number and variety of circular castings if the opportunity occur. No doubt all plate moulding could be machine moulded, and the mechanical drawing of the pattern would often save knocking out a box and ramming it up again; also, if it were rammed by power instead of by hand, a much better result would be obtained, on account of the even ramming.

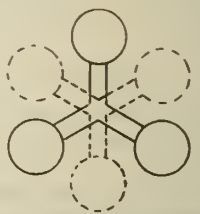

FIG. 7. MOULDING 6 CASTINGS FROM 3 PATTERNS.

It is only necessary to put half the number of patterns on a plate to the number of castings required in the mould if there be a flat back to the work and tooling is not called for on the face. They are arranged so as to clear one another when the top part is put upon the bottom (as shown in Fig. 7), half the castings being in the top and the other half being in the bottom. This will, of course, apply to any plate, whether machine moulded or otherwise.

Machine Moulding.

A few years ago the moulding machine was considered a luxury in the foundry; now it is looked upon by most metal founders as a necessity. The opposition of the skilled moulder to the moulding machine a few years ago was very keen,

but that is now passing away, for he sees that a cheap production of repetition work is relieving him of the monotony of the one job and placing larger and more intricate work in his hands than was formerly the case; for the more delicate and intricate work is not always adapted for machine moulding. There are a great number of moulding machines that demand the services of a skilled moulder to work them, as well as to follow the unskilled workman after he has rammed the work, whether by hand or power, to place the cores in position, and take the vents off in a proper manner, but the greatest economy is made on work of a simple enough character to be entirely handled and closed by the unskilled workman, i.e., the average foundry laborer.

On account of the rough usage all tools in the foundry have to stand, and the sand which is liable to get into the working parts of the machine, it is advisable to consider the durability and the simpleness of the machine before installing one. The machine that will require the services of a fitter in the event of its getting out of order will be an expensive too. In all moulding it is necessary that the moulds be hard enough to withstand the pressure of the metal and also be porous enough to let the gases generated by the hot metal escape, so as to avoid blowing and scabbing. If the right mixture of sand is used, the machine moulder can make a much better casting after he has learned to use his machine than can be produced by hand moulding.

The classes of castings that can be made on the moulding machine depend greatly on the ingenuity of the foundry foreman and his opportunity of getting the pattern-maker to make his pattern in the right way for machine moulding. The indifference of the management may limit the output of a machine, or too much enthusiasm may cause one to go beyond the bounds of possibilities, but it is safe to infer that all castings that can be made in a two-parted box can be successfully made on the moulding machine.

Machine Moulding Advantages.

Among the advantages which machine moulding has over hand moulding are greater output and greater accuracy and uniformity in shape and size. For castings that have to be machined, this latter is an important item, as the tooling is done at a regular rate, and the time and expense saved in the machine shop. Also a much better finish is given to machine-made castings. There are no heavy fins to chip off, the perfect fitting of the boxes and the perfect drawing of the pattern doing away with tooling and mending up of the mould, which in hand-moulding often causes bad joints and bad castings. Also, the cost of trimming is greatly reduced, as machine-made castings, if placed in a rattler, need no trimming whatever, only an emery wheel being needed to grind off the projecting end of a runner or riser.

There is hardly a limit to the size of work that can be made on moulding machines. Very small work can be most successfully done, also large work on machines made for that purpose. Of course, all boxes and patterns must be accurate and must be kept in a state of perfect efficiency to ensure good results continually.

Installing a Suitable Machine.

Before purchasing a moulding machine it is necessary to consider what type of machine is best adapted for the work to be done. It must not be thought that any machine will do any and every job. Also, it is impossible to run a general foundry with moulding machines only. In selecting a machine it is necessary to consider how many different castings can be made on any one machine, and then consider what would be the cost of working the machine, and whether any excess of power that is running to waste in the shape of compressed air or hydraulic power could be utilized for operating it.

The adoption of machine moulding has caused great changes, not only in moulding, but in pattern-making also; for with the patterns for machine moulding being made of metal or hard wood, and not getting broken with the rammer, and with the equal ramming given by the press-head or the jar rammer, the need of venting done away with to a large extent, the patterns do not get broken or spoilt with the vent wire; and the loosening bar not having to be used or holes made in the pattern for drawing, the damage to patterns is much less.

Where possible, it is advisable to ram bottom parts and top parts alternately, for in so doing the moulds can be closed at once, and if cores are to be placed in position they invariably go to the bottom part. This often saves the need of cleaning the moulds of dust and loose sand that will find its way into an open mould, and the necessary mending if anything should fall into it while waiting for the top parts.

Drawing of Patterns.

The drawing of patterns from the mould differs in the various types of machines, some lifting or lowering the mould from the pattern plate which remains fixed to the machine, and some drawing the pattern, while the mould remains stationary as in hand moulding. With machine-drawn patterns it is not so needful to have as much taper as would be necessary with the same pattern if hand-moulded, but if the pattern be undercut, no amount of vibration will insure a good draw on the machine; so it follows that all patterns for machine work must be properly made. An undercut pattern can be made to do if hand moulded, but at the expense of severe loosening and consequent damage. Every type of machine has its adherents. One man will advocate the turnover machine; another will not see the necessity for the turnover. This is to a very great extent dependent on what class of work is required. For shallow work the non-turnover machine is the most economical, as it saves the operation of turning, which operation, of course, takes time, and if not necessary should not be done, even if the work be rammed on a turnover machine.

With the turnover machine the more intricate work can be lowered from the pattern in a perfect condition. Work having deep internal parts, such as pulleys or boxes, are turned out much better from a turnover machine than from a non-turnover machine. With the turnover machine the mould is in the right position for placing on the floor as regards the bottom part, and this often saves irons or gaggers in deep work, as there is no fear of the deep parts falling off, which is likely to happen in the non-turnover if no gaggers are used. As regards the top parts, it is essential that the same work should be done on both machines on deep work, as in both instances the deep or hanging part has to be made secure to prevent falling off when placing the top part on the bottom.

For deep work the jar-ramming machine is undoubtedly the best, as there is no need to hand-ram any part, as would have to be done on a press-head machine. With the jar-rammer the ramming is hardest where it is most essential that the mould should be sound to withstand the strain of the metal and also on the joint. The mould is also rammed evenly, whereas if a hand rammer be used to ram round the deep parts of the pattern, the latter is always liable to get hit and damaged.

Stripping Plate Type.

The machine fitted with a stripping plate is a very useful type for large pulleys or tooth wheels having straight teeth. The pattern is drawn down, or up through the plate, which supports the sand on the edge of the mould, thus insuring a perfect lift or draw when the mould is taken from the machine. This, no doubt, is an expensive machine, as every size of wheel must have its own stripping plate. Knowing how difficult it is to get a perfect draw by hand when moulding a spur-wheel pattern, and how slowly a badly-drawn mould is mended, it is obvious that a machine for this work is very economical if there be suf-

ficient work to justify the outlay necessary.

The different machines on the market are so varied that every metal founder has the opportunity of getting a machine best adapted to his requirements with very little trouble. There is the wheel-moulding machine for those who are making a quantity of spur wheels, no matter what type of tooth is required, whether for helical, straight, or flanged wheels, and up to almost any size. On this machine great care has to be taken in fixing the diameters, and experience is necessary to insure a good result. There are also many types of hand-power press-head machines for small repetition work, giving rapid and economical production; also the hand-ramming machine for deeper work, which can be operated by unskilled labor after a very little tuition.

The Ramming Feature.

At first sight it does not appear that much saving of time can be effected on a hand-ramming machine, but when consideration is given to the fact that the patterns are drawn perfectly true and that the mould does not need patching and tooling, as in the usual jobbing moulding, then it is realized what a great economy is effected on the machine from this aspect only. The remark is often made that a hand-ramming moulding machine is only half a machine; but four or five times the amount of work can be turned out per day than a skilled moulder will do, and the credit must be due to the perfect drawing of the pattern and the saving of time effected thereby. These machines are in great demand where no power is available, and are often more economical to small founders if they can do the work required, as the cost of installing compressed-air or hydraulic power is a big item.

With compressed air or hydraulic power installed, a much greater variety of work can be done, especially where the head of the machine can be altered to suit the depth of the boxes to be rammed. Not only can perfect ramming be done by the power machine, but the vibrating or loosening of the pattern can be done in a most regular and efficient manner, and with the knowledge gained in using the vibrator it becomes common practice to give just sufficient vibration to insure a good draw. Too much vibration is liable to cause the work to fall out when lifted from the machine.

With power machines of this type, it always follows that the sand is rammed hardest close to the pattern and the box, on account of the resistance offered by them, leaving the sand between these two points in a more open condition, thus helping to vent the mould and leaving an open passage for the gases to escape. This avoids the necessity of the venting which would have to be done on hand-rammed work, where the hardest ramming is usually in between the pattern and the box.

Deep Work Machine.

A machine that will do deep work very effectively is the combined jolt-ramming and press-head turn-over machine. The moulds made on this are mainly rammed by jolting, the press head being used to ram the loose sand left on top of the box after jolt ramming. The machine is rapid, and is adaptable to shallow as well as deep work, the number of jolts needful to ram each job being decided by what strain is put on the work when pouring and the weight of the casting required, shallow work requiring less jolting than deep work. The method of working this machine is to fill the box with sand, placing any irons in position, no matter what depth the box may be, give it the required number of jolts, bring the press-head down on top of the loose sand, then strike off the superfluous sand. The box is clamped to the turnover table, which is then turned by power and lowered to the drawing-off plate. Attached to this plate are 4 iron wedges, which are put into position under the box all together by means of a lever, thus insuring the box being parallel to the pattern plate when drawn.

Jolt-ramming machines are greatly in use for large and deep moulds, the machines doing ramming only; but a large amount of time is saved, very large work being rammed in a few minutes which, by the usual method of hand-ramming, would take two men a day or more. As with the small, combined machine before mentioned, the sand and necessary irons, grids, or gaggers are placed in position; the jolt table is then operated by opening a valve, and when the required number of blows have been given the valve is closed and the top of the sand flat-rammed by hand.

It is not necessary to fix the pattern plate to the jolt table, but it must be so placed above it that the weight of the work to be rammed must be evenly balanced. The pattern plate is usually a flat one, the ordinary wooden pattern being placed in the necessary position on it to suit the box, then the box is clamped or bolted to it. When rammed they are lifted off and turned over. The pattern is then drawn by hand and the mould finished in the usual way. The pattern must be flat next to the plate, this necessitating it being made in two when it is not a flat job. Some machines of this type have a pattern-drawing mechanism attached.

Large cores are sometimes rammed on the jolt machine, and then turned out in the ordinary way. All patterns for this type of machine should have no overhanging parts, as the sand would be held up by them. Any side extensions of the pattern that do not touch the pattern plate, or would want a drawback or sloping joint to get them out in the ordinary way of moulding, must be printed and cores made to form the desired shape. All work rammed on the jolt machine is so evenly rammed that the vent wire is very seldom used. The machines are of various sizes and power, some giving a 3 in. and some a 3 ft. jolt, working at a capacity of about 80 lbs. The tables on them range from about 15 in. square to about 8 ft. by 12 ft. or thereabouts. The pattern plates can extend beyond the table if they are made rigid enough to take the weight of the mould and the blow given. The small size mentioned will ram a weight of about 300 lbs.; the larger they are made the more weight they will ram, the mechanism being made in proportion.

Buying Coal on a Systematic and Scientific Basis

By Hugh Lamont

Concurrent with other steps being taken to improve and keep in the forefront, steam as the motive power in our manufacturing and general industrial enterprises, the question of a suitable and uniform quality supply of fuel in the shape of coal is receiving closer attention. In this article are indicated various considerations which contribute to make a careful study highly profitable to the consumer.

THE generation of electrical energy from our waterfalls, and its distribution at cost, through our provincial and municipal governments, has done much to popularize the utilization of electric power in various manufactures, where steam had heretofore been the source of energy. Not a few instances of the discarded steam boiler has been the result, and where the steam boiler has not been discarded, there has been a general "toning up of the system," as it were, resulting in the adoption of the latest and best appliances for in-

creasing the efficiency of the boiler. In other words, the manufacturer who depends on steam for his power has been and is endeavoring to utilize to its fullest extent the heat units stored in his fuel, which is usually coal. In this he has been ably seconded by the fuel engineer, the manufacturer of boilers, the manufacturer of stokers; in fact, by the manufacturer of all kinds of accessories that have for their aim the minimization of losses in the generation and transformation of energy.

Everything that is being done is done with a view to the elimination of losses in the power plant; but the loss annually occurring through unbusinesslike methods of buying coal is one to which the average consumer of this country has given little thought. Practically everything the manufacturer buys is bought under a guarantee of some kind; but when it comes to buying coal, he still continues to buy on the basis of its looks or its general reputation, though it is a self-evident fact that, in order to get the highest efficiency in the power plant, it is first necessary to have efficient methods for the selection and purchase of our source of energy, namely—coal.

Constituents of Coal.

A proximate analysis tells us that coal consists of moisture, volatile matter, fixed carbon, ash and sulphur, and, according to the proportions of these component parts, we have coal varying from the highest grade anthracites through the different grades of semi-anthracite, semi-bituminous, bituminous, down to the lignites.

Moisture in coal is partly due to the moisture existing in the coal as mined, and is partly due to conditions of the weather during transit. At any rate, it has no heating value; but it is there in all coals, and in percentages over which the shipper has no control.

Volatile matter consists of carbon, hydrogen, oxygen, and nitrogen in varying percentages, and is given off as gases during the first stages of combustion. As some of these gases are inert, the heating value of the volatile matter is a variable quantity.

Fixed carbon is the chief source of energy in coal, as the process of combustion consists mainly in the burning of this carbon, together with the carbon and hydrogen of the volatile matter, and with the oxygen of the air introduced through the draft.

Ash is the residue left after all the combustible matter has been burned out of the coal, and consists of silicia, alumina, iron oxide and sulphide, sulphate of lime, magnesia, etc. Coals having ash high in sulphide of iron and fusible alkalies have a tendency to form a slag, which often adheres strongly to the grates, thus seriously interfering with the draft, and are more to be feared on this account than a coal where the ash is high in silica and alumina. Coals having a high percentage of ash are, as a rule, more difficult of combustion under ordinary conditions, than the lower ash coals.

Sulphur exists in coal as iron pyrites, sulphate of lime and as free sulphur. Free sulphur burns readily and has a heating value, though disagreeable odor, but, where found in combination with iron and lime, its tendency is to form a slag as noted above.

Calorimetric Test.

From the foregoing we have a knowledge of the component parts of coal as represented by a proximate analysis, but on account of the variable factor introduced by the volatile matter, an analysis of this description does not always represent the relative heating values of different coals tested in this way. As the heating value of a coal really represents the available energy stored therein, it follows that a comparison of different coals should really be made on a basis of their heating values. This can only be done by a calorimetric test, which consists in burning a weighed portion of the coal in a metallic bomb immersed in a measured quantity of water, and noting the rise in temperature of the water due to the combustion of the coal. The heating value of the coal, thus determined, is expressed as so many British thermal units, (B.t.u.) per pound of coal. By comparing the heating values found by calorimetric tests on various coals with the results of proximate analysis, we often find that coals, of apparently the same analysis, will vary considerably in heat units. This variation is due, as noted before, to the volatile matter.

In the selection of a coal, the consumer has also to take into consideration the adaptability of the coal to his furnace conditions. To determine this factor tests for furnace efficiency should be conducted under actual working conditions. The number of pounds of ashes removed for every hundred pounds of coal fired, taken in conjunction with the percentage of ash as determined by laboratory tests, will give a basis for comparison of the relative adaptability of coals thus tested. For instance: suppose a certain coal shows by laboratory tests ash of 10% value, which would mean that 90% was combustible matter; and that, from the fires, there was removed 25 pounds of ashes for every 100 pounds of coal fired. It would show that instead of burning 90% of the coal, we are actually only burning 75%, and 15% of the combustible matter is carted away in the ash and clinker. It follows that the nearer we approach the 100% mark on these tests the more adaptable the coal is to furnace conditions. In actual practice, an approach within three per cent. is considered good.

Specification Covering Supply.

Having determined by test the kind of coal that may be burned successfully in any given plant, it is important to the consumer that this standard of coal be delivered at all times, and specifications covering same should be made part of the contract under which he buys his year's supply. It is important also that the specifications be so drawn that it will be to the interest of the dealer to carry out his part of the transaction. In specifying the heating value of coal as a basis of a guarantee, the contract should be so drawn that all coal deliveries are paid for on the actual heat units contained in the dry coal. This automatic system of regulating penalties and bonuses is arranged for by specifying in the contract, the net B.T.U. to be delivered for one cent, thus:—

Suppose the contract calls for coal containing 14,000 B.t.u. per pound, at a price per ton of $1.90. This means that for every ton of coal delivered, the consumer is to receive 28,000,000 B.t.u. (14,000 × 2,000), for which he agrees to pay $1.90, or, for every cent expended, he is to receive 147,368 B.t.u. (28,000,000 ÷ 190c.). This then is the basis of the contract and all coal delivered thereunder should be carefully sampled and the B.t.u. value determined by calorimetric test, and all coal represented by each sample should be paid for in accordance with the heating value found.

For instance, suppose a sample represents 100 tons of coal, guaranteed as above. Actual tests, however, show that the coal contains but 13,800 B.t.u. per pound, or (13,800 × 2,000), 27,600,000 B.t.u. per ton. As the contract calls for 147,368 B.t.u. for one cent, the 100 ton unit, as mentioned above, is worth only (27,600,000 ÷ 147,368), 187 cents, or $1.87 per ton, the price which should be paid. Suppose, on the other hand, however, that the coal delivered shows by test a value of 14,200 B.t.u. per pound or (14,200 × 2,000), 28,400,000 B.t.u. per ton, then, as the dealer only agrees to deliver 147,368 B.t.u. for one cent, the value of each ton in this case becomes (28,400,000 ÷ 147,368), 193 cents or $1.93, the settling price.

It has been pointed out that, with one exception, the heating value of a coal represents its money value. The exception is in the ash. The higher the ash, the more difficult it is to burn out the combustible matter, and the reduction in price, in accordance with the calorimetric test, does not make up to the con-

sumer the loss in furnace efficiency and added expense for removal of excessive ash content. It follows then, that there should be a limit placed on the per cent. of ash allowable, and some provision made for the rejection of coals exceeding this limit, or for acceptance at a reduction in price greater than that due to the B.t.u. This precaution is necessary to prevent the substitution of inferior grades where it has been demonstrated that a high grade coal is an absolute necessity in obtaining good furnace efficiency.

The consumer will likely find a reluctance on the part of the coal dealer toward a guarantee as specified herein, but, when thoroughly understood, a contract of this kind is eminently fair to both. It protects the dealer who is prepared to furnish high grade coal in competition with dealers handling inferior coals at the same price. It encourages him to deliver coal above contract grades by providing a premium for all coal thus delivered, and, on the other hand, the consumer will find it to his advantage to pay a premium of the extra heating value delivered.

This plan has proven successful in many localities, and will prove itself satisfactory wherever the specifications are carefully drawn, and the consumer and dealer alike, have a knowledge of the basic principles that tend to make for efficiency in the coal pile.

G.T.R. STRATFORD APPRENTICES' BANQUET.

THE apprentices of the G.T.R. shops, Stratford, Ont., held their ninth Annual Banquet on the evening of March 23rd in the G.T.R. Assembly Hall there, which was tastefully decorated by the Ladies' Auxiliary of the band. About 200 apprentices and guests were present, including delegations from the shops at Battle Creek, Mich., Montreal, Toronto and Ottawa. Mr. Robert Patterson, master mechanic, made a very able chairman, and he had on either side several prominent officials of the G.T.R. System, including H. G. Kelley, vice-president; W. D. Robb, Supt. motive power; J. H. Guess, general purchasing agent, and J. M. Markey, master mechanic, Toronto shops, while other prominent guests included Mayor Stevenson, of Stratford, M. C. McLeod, president of the Board of Trade, Stratford; Dr. Silcox, principal of Stratford Normal School, and C. A. Mayberry, principal of Stratford Collegiate Institute. Representatives of the Stratford "Beacon" and "Canadian Machinery" publications were also present. The G.T.R. band was in attendance and played several selections during the banquet, after which there were vocal and instrumental selections, and recitations between the speeches; all numbers being encored with great enthusiasm by the apprentices.

The chairman opened the proceedings with an interesting address on the "Work Done by Apprentices," remarking that very satisfactory results were being obtained, and that a high standard was being achieved. Mayor Stevenson and Mr. McLeod referred to the progress being made by the city of Stratford.

PROGRAMME.

Chairman's Address .....
Mr. R. Patterson, Master Mechanic.
Toast—The King .....
God Save the King.
Toast—Our City .....
Mayor Stevenson.
A. C. McLeod, Pres. Board of Trade.
Quartet—Selected .....
Messrs. Barnsdale, Choyce, Wilkinson and McLean.
Toast—Grand Trunk Railway System..
Mr. H. G. Kelley, Vice-President.
Song—True Till Death .....(Gatty)
Mr. C. Kelso.
Toast—Motor Power Department.....
Mr. W. D. Robb, Supt. Motive Power.
Recitation—The Little Hero .....
Miss Helen Mar Patterson.
Toast—Our Ex-Apprentices .....
Mr. Bruce Dunlop and Donald Ross.
Instrumental Duet—The Elks' Parade..
.....(C. W. Poe)
Apprentice W. Plummer and J. Millman
Toast—Our Apprentices .....
H. Colombo and F. McInnes.
Song—Selected .....
Apprentice E. Davis.
Toast—Our Visiting Apprentices .....
Apprentices from Montreal, Battle Creek and Ottawa.
Recitation—Selected .....
Miss Helen Mar Patterson.
Toast—Our Educational System .....
Dr. Silcox.
Instrumental Solo .....
Apprentice H. Schultz.
Toast—Industrial Training .....
C. A. Mayberry.
Song—The Mighty Deep .....
Mr. J. Wilkinson.
Mr. J. Bottomley .....Accompanist
Caterers..Ladies' Auxiliary of the Band
Music .....G.T.R. Orchestra

Mr. H. G. Kelley, in responding to the toast of the "G.T.R. System," in a thoughtful address, outlined the history of the road, remarking that the apprentices might profit by the good work done and example set by the engineers who located and built the road, which the speaker said was a work that could hardly be improved upon. Mr. Kelley gave some helpful advice to the apprentices and dwelt at length on the value of technical training.

Mr. W. D. Robb in responding to the toast of the "Motive Power Department," said that he had been in the service of the company 43 years and proceeded to review some of the changes which had taken place in that department during these years. Mr. Robb also gave some interesting information regarding the development of locomotives, showing how they had increased in size and also in cost since his appointment to the present position in 1901.

The toast, "Our Ex-Apprentices," was responded to by Messrs. B. Dunlop and D. Ross, while the reply to "Our Apprentices" was undertaken by Messrs. H. Colombo and F. McInnis. "Our Visiting Apprentices" was handled in an able manner by Messrs. —. Boast, Montreal; G. Patrick, Ottawa; W. Browning, Toronto, and C. Kapenke, Battle Creek, Mich.

Dr. Silcox made some interesting remarks on educational systems, touching briefly on technical education in Denmark and Switzerland, and emphasizing the value of the G.T.R. apprentice system. Mr. C. A. Mayberry gave an address on Industrial Training.

The banquet was conceded by all as being a great success, and reflected great credit on the apprentices who paid for and carried out the entire arrangements. A pleasing feature was the enthusiasm and esprit-de-corps shown by the present and past apprentices and their recognition of the efforts which are being made by the motive power officials, especially by Mr. Patterson, to help them in their work. The proceedings terminated at midnight by singing of the National Anthem.

Cooling Electric Generators.—In an article which appeared in the General Electric Review recently, on "Ventilation of Steam Turbine Engine Rooms," attention is first called to the increasing amount of power that is being put into engine-rooms per cubic foot and per square foot of floor area, thus rendering the cooling of the generators a more difficult problem, apart from the fact that high-speed generators are of smaller dimensions per kilowatt. The design of air ducts is considered for conveying cooling air to the generators, and formulæ are given for this purpose. It is shown that the amount of heat that can be absorbed by saturated air is only very little above that which can be absorbed by dry air; consequently, not much is to be gained, from this point of view, by the use of spray filters. On the other hand, the temperature of the air is lowered much more by apparatus of this kind than is practicable by other means. Curves are given showing the size of spray filter that is necessary, and figures are given showing the gain by the use of such plant under various climatic conditions. A brief reference is made to the possibility of using the heated air from the generators for supplying the necessary draught for the boilers.

The Psychology of Rest Relative to Modern Business Life

By George Sherwood Hodgins*

A poor attempt at recuperation is made by the man who looks on his out-of-business time as so much loss, and who thereby causes it to be a period of dull routine. The present-day tendency is almost wholly towards the above-mentioned state of being, and finds exemplification in our business enterprises all the way from centre to circumference of their personnel and organization.

I ASKED a busy man why he did not take more time to rest, and he misunderstood me. He confused rest with lack of activity. I explained that I had not suggested that he should do nothing, but simply that he should change the form of his activity. He replied with the least touch of superiority in his tone: "My dear fellow, do you suppose a passenger car on the Pennsylvania Railroad, constantly traveling between New York and Pittsburgh, would hope for rest if it should be run on the New York Central between here and Albany?" and he triumphantly added, "That would be complete change of activity and change of scene also."

I pointed out that the car, when on the New York Central, would run upon a track having the same gauge as that of the Pennsylvania Railroad; that the wheels would revolve just the same on both lines; that their motion would be arrested by the same brake, and the whole running gear would be subjected to similar conditions on either railroad. But I also made it clear, that if the car had been structurally adapted for railway service and was also capable of floating in water, and had been towed up the Hudson River to Albany, and, moreover, if it had a brain capable of being tired or refreshed, then the change would be highly beneficial—to its brain.

The Human Brain.

The human brain is always active, and it is impossible for a man to stop thinking, though it is possible for him to direct his thoughts. In sleep the brain is less active, but consciousness, in the strict sense of the term, never departs. A person accustomed to the quiet of the country at night may not be able to sleep in a large city hotel. He is constantly awakened by what are to him the unusual noises of the street. There is the clang of the overworked street car gong, and the cry of the newsboy with the so-called "extra." There is the melancholy whistle of the river boats and the tolling of bells for the hour, as if everybody did not carry a watch. On the second night he fares better, and thinks he rested well because he was tired after his first night. He misses the fact that the alert brain, which at first kept the mind active, finding later that the noises do not mean danger, did not, on the second night, arouse the sleeping limbs.

The brain is normally rested by sleep, the directing will is temporarily withdrawn, the body is relaxed and the darkness and comparative stillness reduce the number of external impressions received. The rebuilding of brain tissue is greatest and the strain caused by cerebral activities is reduced to a minimum. The brain is a wonderful development of bodily structure. Science tells us that the brain of a fish is very small compared with its spinal cord and with the nerves which branch out from the cord. In reptiles the mass of the brain compared with the spinal cord is greater than in fishes. The brains of birds show an advance over those of reptiles. The lowest mammals exhibit a superiority in this direction over birds, the higher mamalia are a step above, and the series culminates in man.

All through these gradations the increase in proportion of brain to spinal cord has been paralleled by the increased development of the sense organs. The brain appears to have had its origin in nature's endeavor to provide the necessary and highly complex terminals for the reception of sense impressions. The nerves of sight, hearing, smell, taste and touch respectively reach in the brain corresponding masses of specialized nerve cells, responsive only to the appropriate call of each. Modern science has succeeded in locating certain brain regions as being the seats of certain sensations, and the governing centres for the movements of particular limbs. A severe blow on the left temple will deprive a person for a time of speech. Another tract has to do with the movement of a hand, another with a foot and so on.

Reflex Action.

Many actions are involuntary, such as the closing of the eyelid at the sudden approach of some object. Here the ingoing stimulus reaches the brain and is "reflected" into an outgoing stimulus which reaches and acts on the muscles of the eyelid. The act of closing the eyelid is performed without the impulse producing in the brain any consciousness of the process. This action is said to be "reflex," and all constantly repeated actions tend to become reflex. Nearly everyone has noticed when walking on the street that it is actually easier to pass over a longer distance in going around behind a slowly moving vehicle, thus maintaining one's speed, than it is to stop and wait for the vehicle to go by. Stopping and waiting would have been a conscious act. This is a bit of nature's economy. The fatigue caused by a reflex act is less than from a conscious one.

Example of Reflex Action.

Huxley gives an interesting example of reflex action pure and simple, in which the spinal cord is concerned. A frog was decapitated and placed on the table. It was, of course, incapable of volition. When a drop of vinegar was placed on the top of one thigh, the foot was drawn up and a distinct effort was made to rub off the irritating acid. When ths leg was held, the other foot endeavored to rub off the vinegar.

We often speak of a thing happening "as quick as thought." The rate at which nerve impulses travel vary from sixty up to perhaps ninety feet a second. In man the time occupied for a reflex action is negligible, but if the Statue of Liberty in New York Harbor came to life and was bitten on the foot by a mosquito equal to the task, the nerve impulse traveling at the speed of an express train would require about two seconds to reach the head. The return impulse, taking the same time, would allow the mosquito (perhaps the size of a puppy dog) about four seconds ere the goddess would move her ponderous foot and shake the insect off.

Some scientific men, studying the many strange reflex actions of which we are capable, and having regard to sense impressions, have called us "conscious automata." They say a dog seeing a rabbit has his brain stimulated by the optic nerves, and that the brain in turn stimulates the muscles of his legs, and pursuit of the rabbit results. They say the dog did not hunt for the rabbit in the first place, but seeing it he automatically pursued it, because the once conscious act of his ancestors has become a reflex action to him. The fact that "reflexes" sometimes look like conscious efforts of the will, may explain many of our so-called impulsive acts. Shakespeare says in King John, "How

*Asst. Engineer, Mechanical Dept., N.T. Railway, Ottawa.

oft the sight of means to do ill deeds, makes ill deeds done."

The investigations and theories outlined above prove that man is after all a very complicated piece of mechanism and needs care and special attention like any other piece of delicately-constructed machinery. Arnold Bennett truly says: "In case of friction, the machine is always at fault."

Sameness Tends to Brain Fatigue.

Character is the sum of our habits, and they are formed for the most part unconsciously by daily repetitions and without definite plan. Doing what we dislike, the talk of a bore and the effect of "things going wrong" produce a mental state which, when it reaches the point of fatigue, produces a poison which alters the constitution of the blood. The constant recurrence of identical stimuli, i.e., the same thing over and over again, invites a form of fatigue, as when one is constantly associated with an unpleasant personality in the office or elsewhere. All this does not produce any serious result in the brain of the average man provided he has sufficient recuperative powers. In some it produces irritability, and irritability is a bad brick in the foundation of character. Mirth and humor are the antidotes for irritability. It is probable that the popularity of comic opera and the buffoonery of the vaudeville stage are commercial attempts to supply, artifically, what habitual good humor would do of itself. The proper view to take of those we meet in daily life is to regard them as the raw material out of which we must make a happy day for ourselves, not by walking over them, but by mingling with them on friendly terms.

A Dangerous Zone.

When we come to sheer hard work with the brain, we are close to the danger zone for many a business man or factory head. Attention to one thing or one line of thought is a strain very like excitement so far as the effects are concerned. It takes more blood to supply a hard-worked brain than it does for the same brain when it is tranquil. An excited man finds that his temples throb. More blood is needed because the waste of tissue is greater. Nature here endeavors to introduce a sort of economy. Close attention causes many external impressions to be shut out from the consciousness. The process of shutting out external impressions assists in maintaining attention, but while it helps the worker for a time, it has its effect on the brain. Cats, both large and small, which lie in wait for their prey develop such concentration of attention as practically to deaden the other faculties. When in this state hunters can usually approach them without being perceived. A man may work hard amid noise and disorder, but in time fatigue appears as nature's protest against the strain of work, the noise and the distractions caused by the disorder, and the attention automatically slackens.

A poor attempt at recuperation is made by the man who looks on his out-of-office time as so much loss and who causes it to be a period of dull routine. Such a man is like one who laboriously applies a highly-tempered tool to the muddy surface of a water-soaked grindstone. The real recreation, or recreation as the word is, may be had by him who enjoys the happy home circle with its wholesome non-business atmosphere. The wordy war of wit among congenial friends will strike his cares and worries off in scintillating flashes as a spinning emery disc strikes glowing sparks from a surface of dulled steel.

Examples of Overworked Brain.

An illustration of breakdown from an overworked brain is given by Prof. Mosso, an Italian psychologist. A dozen men in apparently good health, if exposed to the weather for some hours on a very cold night, will give evidence of the physical strain in different ways. One will have a cold, another a sore throat, another will develop pneumonia, still another will have intestinal disorder, while others will not be seriously affected. The exposure to cold found the weak points of those it touched and disease entered through the unguarded gate. Apparently normal men differ widely in temperament, and temperament depends principally on the nervous system. If the nervous system is run down, the cumulative effects of constant small overstrains with insufficient recuperation, are like the oft-repeated stresses in a bar of steel, each below the elastic limit, yet they produce in time, if no remedial or heat treatment intervenes, the slow creeping "facture in detail" and the final, sudden snap.

Brain Power Stocktaking Essential.

The man most concerned does not realize what he is doing when he overworks his brain, and so it happens that very little care is taken of the real "working power" of the great business enterprise. Friends may see it, but the brain of the tired man works on, oblivious of its own condition. It is wisdom for each man to stop and "take stock" of his powers. In nine cases out of ten the man who breaks down does not expect it. It is this "skating on thin ice" by a man who has no idea of his mental whereabouts, which causes his partners or business associates to insure his life, and pay the premiums themselves. This they do as a safeguard for their own interests, so that when the "business head" of the organization or the "brains" of the enterprise shall collapse, they will not be left without the results of his concentrated and forced effort to do the work, the whole work and nothing but the work, every day, all day, and many times at night.

Distraction Helpful.

"If you want something done, go to a busy man," so runs the proverb. But the busy man who can help you is he who is willing to use, to his own mental advantage, the wholesome distractions that daily

A MODERN PICTURE.

THE average business man will perfect every detail in his factory. He will supervise his organization, cheapen production, introduce safety appliances, look to his fire protection, revise business methods, secure new contracts, listen to shopmen's grievances, facilitate the handling of material, market his product, advertise his wares, direct expenditure, point out economies, keep efficiency before the working force—and yet he will not take ordinary common-sense care of the "guiding principle" of the whole thing. He would make more fuss if the roof leaked, than if he felt his head swim at his work. It is impossible to put in accurate per centage the difference in time and mental force, which he expends on his work and on the care of himself. It is, however, an extremely conservative estimate to say that the care of himself stands in proportion to his work, far less than the duration of a lightning flash does to the time occupied in the passage of a heavy and prolonged thunderstorm. If an outsider from the planet Mars saw only this man's actions, the visitor might declare that the man's evident desire was to build a machine to make money and to put himself under the sod as quickly as possible.

life affords. Prof. Mosso tells us that most people take 134 thousandths of a second before responding with the hand to a touch on the foot. Fatigue of attention increased the time to 200 or 250 thousandths of a second, an increase of 49 and of 86 per cent. respectively. A steady worker thinks more slowly as time goes on. This is the cost of being tired.

As yet science does not attempt to measure the value of cerebral effort. It may be physiologically the same to think out a money-making act as it is seriously to consider the appropriate filling of the children's stockings at Christmas. The result in the one case may be dollars and cents, and in the other your own satisfaction and a group of happy youngsters. The real value to you lies in the change of thought it produces, and your mental health is evidenced by your willingness and your ability to change. Look out for yourself when you only want to do one thing; it's a sign of old age that you do not need to have. Everybody admires a fine automatic turret lathe, and the cause of the admiration is that it can perform more than one operation, cleanly, expeditiously and with vigor. Your range is almost infinite compared to the best turret lathe ever made. The human mind, healthy and alert, travels on no particular set of rails. Its ability to change from one thing to another and to gain rest by the change, is at once its marvelous faculty and its salvation.

Use of the Business Head.

The danger of brain-fag is peculiarly ours. Prof. G. M. Beard, the noted American neurologist, was convinced that in no other country is nervous exhaustion so common as in the United States, and that no other country exhibits so many varieties and symptoms of nervous debility. Prof. Mosso believes that among politicians and business men the effects of overstrain are most marked. The remedy is simple enough, and it is constantly given by friends to one another at the moment of parting. "Well, good-bye, old man, take care of yourself." But the reply, "Yes, yes," is meaningless, and the self-constituted drudge goes back to his limited horizon bounded only by his work.

This man will perfect every detail in his factory. He will supervise his organization, cheapen production, introduce safety appliances, look to his fire protection, revise business methods, secure new contracts, listen to shopmen's grievances, facilitate the handling of material, market his product, advertise his wares, direct expenditure, point out economies, keep efficiency before the working force—and yet he will not take ordinary common-sense care of the "guiding principle" of the whole thing. He would make more fuss if the roof leaked than if he felt his head swim at his work. It is impossible to put in accurate percentage the difference in time and mental force which he expends on his work and on the care of himself. It is, however, an extremely conservative estimate to say that the care of himself stands in proportion to his work, far less than the duration of a lightning flash does to the time occupied in the passage of a heavy and prolonged thunderstorm. If an outsider from the planet Mars saw only this man's actions, the visitor might declare that the man's evident desire was to build a machine to make money and to put himself under the sod as quickly as possible.

Remedy Easy—Medicine Pleasant.

The remedy is easy and the medicine pleasant to take. You can best mind your business when you make a business of your mind. Did you ever stop to think what an ocean of pleasure and interest lies stretched out beyond your narrow shore? As a healthy change, you can read history and mark the slow but sure advance of personal liberty. You can play golf, tennis, polo or what you will. You can be the home carpenter and man-about-the-house. You can study physics and discover enchantments in the commonplace things of life. You can roam unhindered in that fairyland of science, astronomy, and on a starlit night you can pick out the constellations as they "burn in the velvet blue." If you are observant go into the woods and look with new interest on the flowers and the trees. A few summers ago, you might have seen the cicades, after seventeen years of grub life in the earth, turn into winged locusts for about three weeks and die. You can compare their life's effort with your own, and it may be worth while.

Whether you read, or play, or work, or search, or observe, you must give up the steady, killing grind. Enjoy yourself in many different ways, for what shall a man give in exchange for his life?

DESIGNING FOR REPETITION WORK.

By A. Whitehead.

PRACTICALLY all designing falls in between two extreme classes:—

1.—Designing with a view to insuring the utmost efficiency with little regard to first cost.

2.—Designing without regard to efficiency, the aim being to produce at such a low price as to command a certain sale.

In most cases a machine of stated capacity must be sold at a price which is fixed principally by conditions outside the control of the makers. Only when a firm has a monopoly by reason of patent rights, or of attainment superior to that of its competitors, can price be independently fixed at the firm's own discretion to suit their particular designs and workshop practice.

Nor is price fixed solely by external factors. Fashion (perhaps that is rather a harsh word) plays a great part in settling many features of design, so that, to a very large extent, the average designer is restricted to inventing mere minor variations from the standard furnished by previous experience, wedded to the prevalent fashion. Thus, the common task of the designer is to make these minor variations tend towards increased efficiency and economy, so far as his skill and knowledge enable him. In order to prepare a successful design, it is necessary to have a good knowledge of—

1.—The essential features and properties which the contemplated machine must possess.

2.—The best way to obtain the desired results by mechanical means feasible with the available plant—that is to say, it is necessary also to know:

3.—The resources of the available plant.

Designer's Shortcomings.

Information respecting the first in order may be collected by someone in touch with customers and the work of rivals, and imparted to the designer to supplement his gleanings from sources accessible to him. He is usually suitably placed to find out whatever he wishes to know in connection with the third point; but, unfortunately, a designer thinks in forms—cylinders, cones, and so on—simply combined in the ways which he has been trained to believe the only possible ones for economical production. Musical composition affords an excellent parallel. The composer thinks in harmonic combinations, which he is trained to believe are the only acceptable ones; but the great composer, with superior mastery of technique, will never hesitate to violate accepted canons if, by so doing, he can obtain the effect he seeks. Lesser men attain far less success with far more commotion.

The composer whose highest experience had been confined to compositions suited to the capacity of two trumpets and a drum would not readily grasp the possibilities of a full orchestra, except in point of the volume of noise. In a similar way the average designer often fails to perceive what may be done with a modern plant. His lack of technique does not allow him to distinguish between manufacturing proper and mere bulk production.

A Question of Service.

Individually simple instrumental parts may, when played together, sound tremendously difficult. So simple machine-shop processes, properly directed, may produce pieces which, when completed or drawn out on paper, appear extraordinarily difficult and quite commercially impossible. If one expensive-looking piece will do the work of a unit built up of two or several simpler pieces, and have the merit of being less clumsy, with a probability of giving better service, it is always worth considering whether the expensive-looking piece is so bad from a manufacturing standpoint as it appears superficially. Again and again experience shows that it will not be so—if it is to be made in numbers. Here is an actual instance.

A unit built up of two pieces was a continual source of trouble. The makers were loath to abandon the design of which the unit formed a part on account of its general excellence. There was one solution, however, ideal in some respects, which had never been seriously considered because it involved an unusual boring operation. It depended on the possibility of cheaply boring a hole, not round, but shaped like a circle with four evenly-spaced flats, each subtending 30 degs. at the centre. Broaching was out of the question, so boring was tried and was found successful in every way. The piece is now being produced in large quantities accurately and cheaply on an automatic chucking machine. Moreover, the method employed is universal in application. Within certain limits a hole or bar (for with modifications a like method can be applied to turning) can be produced of any shape desired—elliptical, for instance. Furthermore, the longitudinal section need not be rectangular; it may be "barreled" or of any simple curved form, and can be produced without the use of a single form tool. The rate of production is nearly as high as for plain work. The error need not exceed 0.002 in. in diameter. One may safely assert that the possibilities this reveals are in excess of any likely requirements in its range for many years to come.

It is worth noting that the draughtsman seeking advice on some question of manufacture is usually most concerned and worried over features which make little or no practical difference. Real difficulties often arise from such insignificant-looking causes that the same draughtsman would lightly ignore them.

Need for Getting Out of the Rut.

If a designer be not already expert in shop practice, one cannot anticipate that he ever will be. Even a few years of office work destroys much of an engineer's familiarity with shop practice in the minor details; his knowledge gets rusty. For these reasons, most designers may desirably be instructed to take the utmost licence; to aim at excellence, and forget cost for the preliminary trial plans. Cost may be taken into account at the second attempt, after discussion with the manufacturing authorities. Though counseled to take the wildest freedom, few men would shake themselves free from the fetters imposed by early training, and be really bold. Few would cause so much trouble to the manufacturing experts as would some junior fresh to the business.

An an example of how prevalent ideas need modification, the following example will serve. One is taught to design shafts with as few steps as possible in order to economize the machinist's time. It is asserted that every additional step will consume extra time for gauging. Presumably the same reasoning applies to short stems and boring on a chucking machine. No doubt the theory is true enough for old-fashioned conditions, but a number of steps is frequently a great advantage on a manufacturing machine, because they can be turned simultaneously. As for gauging, but little is required after the first "set-up." Most work required within fine limits of error is ground nowadays, and it is quite certain that any little extra time in grinding several different diameters would never balance the time previously saved; it might generally be ignored.

Grinding.

Speaking of grinding brings to mind grinding with form wheels. One well-known instance is the grinding of crank-shaft journals with a wheel the same width as the journal itself. This is purely form grinding, and should not be confused with the ordinary method. Any profile can be ground providing the diamond can be made to trace it out in the wheel in a suitable manner. The simplest examples are a straight line and an arc of a circle.

There is hardly a limit to the shapes which can be milled. Internal shapes can be broached; or if that be impossible, it is perhaps permissible to modify the design a little, treat it as a gear problem, and cut the work on the Fellowes gear-shaper. With these three methods, the manufacturing time may most likely be hardly any longer on an intricate than on a plain shape.

One last process may be mentioned—die-casting. Here, providing the present limited range of metals which may be cast in dies can supply him with one having the qualities he needs, the designer can work his will very freely. The advantage to him is not so much that he is at liberty to call for fantastic shapes if he has the mind, as that the design can be more refined than is practicable with the ordinary machined casting, and probably less expensive unless his requirements are extremely simple.—Engineering.

MUST FACE UNEMPLOYMENT EVIL.

"UNEMPLOYMENT is not merely a matter of statistics to juggle with," declared Mr. G. E. Jackson, of the Department of Economics in University College, during the course of an address before the Social Science Club at McMaster University recently.

"This problem of unemployment must be looked at in its proper perspective and in human terms. There is danger of our getting out of touch with the fact that unemployment results in actual suffering in the lives of the people affected. Their physiques are impaired, their stamina is lessened, and some of them are driven to crime.

"The greatest need in connection with this question is more knowledge. We know a certain amount—for example, we know that bad winters come with quite remarkable regularity, and, therefore, can be warned to look out for unemployment before it comes, and we know the causes of unemployment. What we do not know in regard to the situation in Ontario is the real extent of unemployment, what proportion of it is due to seasonal causes, and what to cyclical, what amount of work could be provided for men in the Canadian woods in winter, and, among the unemployed, the proportion of good workers and those known as 'work-shy.'

"The question has been taken up by the Social Service Commission, in the Ontario Legislature, and by the Church, and the discussion on all three of these sides has been of great value. What will happen now will depend entirely on what interest the public takes. Those who are interested should agitate and keep the question to the front. It is not merely a local phenomenon which will not reappear. There will be more or less unemployment next winter and every winter, and at some fairly well-defined intervals there will be another heavy attack of the same disease."

Mr. Jackson said that a university course should be a training for public life. It must not turn out merely technically trained men, but men who will take a broad view of social problems such as unemployment.

Eric Buckler, of Calgary, sailed last Saturday from the Old Country, with a member of the great china manufacturing firm of Doultons, to examine the china clay deposits of South Alberta, and possibly to start a factory.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

BORING A HOLE TO MATCH CAST BOLT HOLES.

By F. H. MAYOH.

THE purpose of this article is to describe an accurate method of machining the piece shown by Fig. 1; the word accurate in this case meaning, handling the work in such a manner that when the centre hole (A) is placed in a chuck and bored, the two small holes at the sides which are cast in the piece will come in the correct position to slip over two bolts in the piece that this one matches with when assembled in place. After these castings come from the foundry they are snagged and sent to the turret lathe where they are handled as follows:

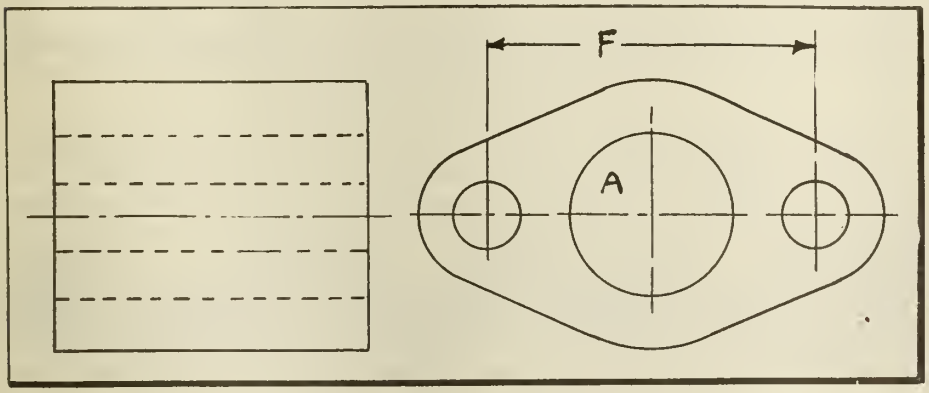

FIG. 1. PIECE TO BE MACHINED.

First, the piece is placed in a two-jaw chuck which has special jaws as shown by Fig. (2). Here, the hole in the centre is bored and reamed with the tools shown, after being lined up by the gauging plate (B) which, for convenience, we will say is placed on the first turret face, and consists of a shank (C) upon which is mounted a cast iron plate (D) with two studs (E) held in it. These studs are made a little larger than the bolts that go through the work being machined, and are set to correspond to these bolts for centre distance (F), Fig. 1.

After setting the work in the chuck, it is tested by this plate to see if the small cast holes are in the correct position by bringing the turret forward with the first turret face which carries the gauge in the correct position for trying the studs in the holes to see if they line up, or if they are in the correct position for boring the centre hole. If not correct, the chuck is adjusted in the usual manner until a satisfactory alignment is secured, then the work is rough bored by a flat cutter and bar (G), and rough-faced by a tool (H) held by the second turret face and front cross slide block respectively. Next, the turret indexes, bringing the finish boring bar (I) with pin cutter into position for finish boring, while the work is finish-faced by a tool similar to (H) but opposite hand and held by the rear cross slide block.

To complete this operation and leave the hole in a good smooth condition, true to size, it is now reamed by the reamer (K) on the fourth turret face, and layed one side ready for the second operation of facing the rough end nearest the chuck. This is accomplished by placing it on an arbor, Fig. 3, in the engine lathe and facing it by tools held on the cross slide similar to those used for the first operation, thus completing the machining on this piece in a neat manner, and insuring against having the small holes and the large centre holes coming in all sorts of places but the correct one.

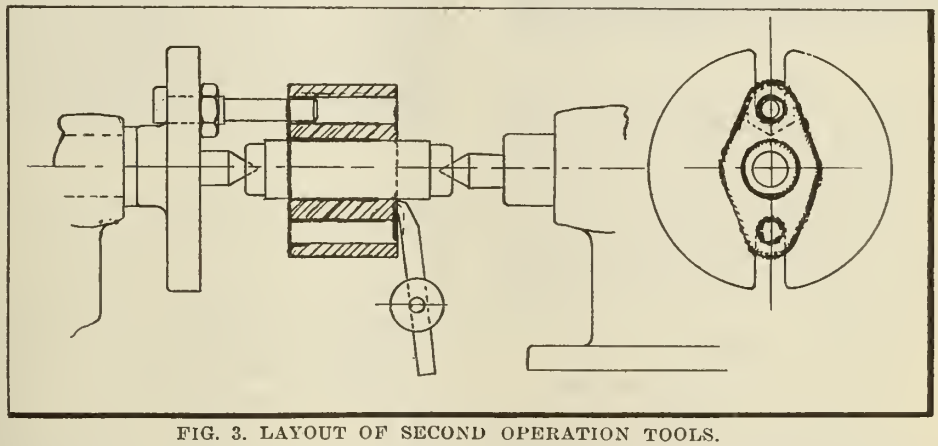

FIG. 3. LAYOUT OF SECOND OPERATION TOOLS.

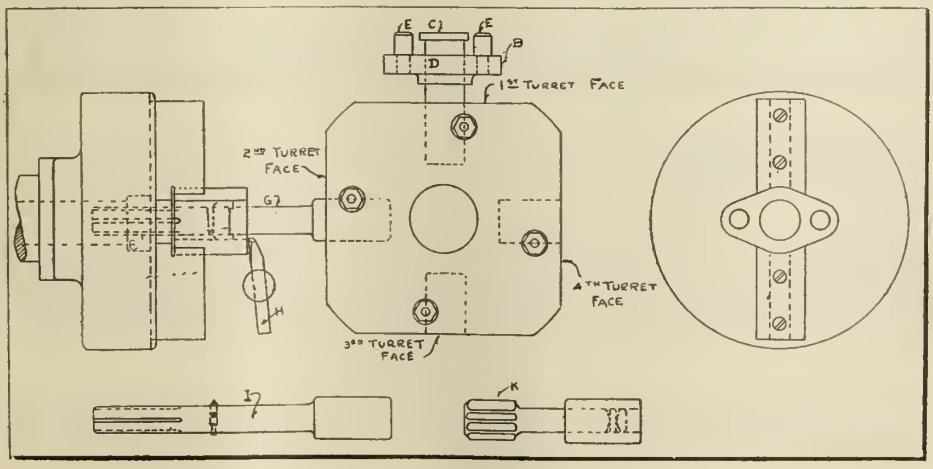

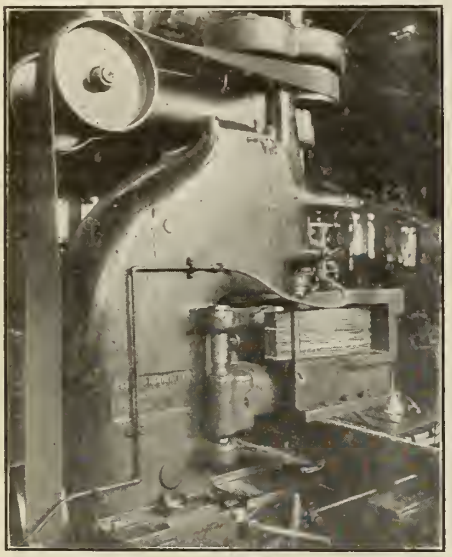

FIG. 2. LAYOUT OF FIRST OPERATION TOOLS.

MILLING PASSENGER CAR PEDESTALS.

By A. E. W.

THE accompanying illustration shows the method adopted by the Canadian Pacific Railway at their Angus Shops, Montreal, for machining passenger car pedestals. The work is done very expeditiously on a No. 8 vertical milling machine built by Alfred Herbert, Ltd., Coventry, England. The pedestal plates are milled in batches of seventeen at a time,

being held in a special fixture, as clearly seen in the half-tone. The gap to be milled is 19½ inches deep by 14 inches wide, with a 3¼-inch radius at the top corners. About ½-inch of metal has to be removed, this being done in one cut. The plates are ¾-inch thick, so that the total thickness to be milled is 12¾ inches. This is done by a cutter 13 inches long by 6½ inches in diameter, which is piloted at its lower end by an arbor support, or steady bracket, supplied with the machine and observable in the illustration. This arbor support plays an important part, as without its use it would of course be practically impossible to get a smooth finish, unless a much lighter cut were taken.

MILLING PASSENGER CAR PEDESTALS.

This machine has feeds 62 in. x 28 in. x 38 in., and is understood to have been the means of greatly reducing the cost of milling the pedestal plates at the Angus Shops.

STANDARD LATHE ARBORS.

By R. C. Dickens.

IN ordinary shop practice little effort is made as a rule to standardize ordinary shop tools, such as plug gauges, reamers, solid and expansion arbors; the result is a motley collection of tools, each designed for the job at hand and largely by guess. I have endeavored to show by means of the accompanying drawings that, by a judicious use of tabulated sheets, the tool equipment of the average lathe department can be much improved both as to uniformity of product and efficiency of operation. The same line of reasoning applies to tool equipment for machine tools as to the machine tools themselves—that is, when machine tools are all of one make less confusion is occasioned when transferring men from one machine to the other, for, if the workman be familiar with one machine, he is familiar with all.

In the drawings above mentioned four types of expansion arbor are shown for four distinct lathe operations. The type shown in Fig. 1 is used for that class of work which requires to be finish turned to a certain diameter and faced to length, having been previously bored and faced on one end. No difficulty will be experienced in determining the class of work on which it may be employed.

FIG. 1. TABULATED SIZES.

Fig. 2 shows an arbor of the same general style, but used on bushings that have previously been bored and faced on one end, and which it is desired to face throughout the entire length.

Figs. 3 and 4 are for bushings, as illustrated by drawings (c), which, having been bored, it is desired to finish, turn and face to length in one operation, using a gang tool for the facing operation set to the length required. The arbors shown in the last two figures are for similar work, only of a heavier duty nature.

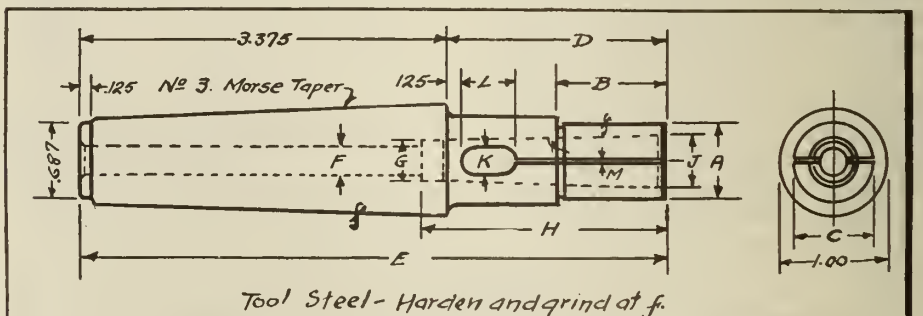

FIG. 2. STANDARD LATHE ARBORS.

In order that there may be no confusion, I will set out the figures for an arbor of the type shown in Fig. 1 for a

Dia. of Arbor From	Including	X		D	F	G	H	J	K	L	M	Expander Size	Expander Length
.312	.50	.625	When B=X or is less	X+.75	.203	—	—	.239	.25C	2K	.031	B&S #1	E+1.00

FIG. 3. TABULATED SIZES.

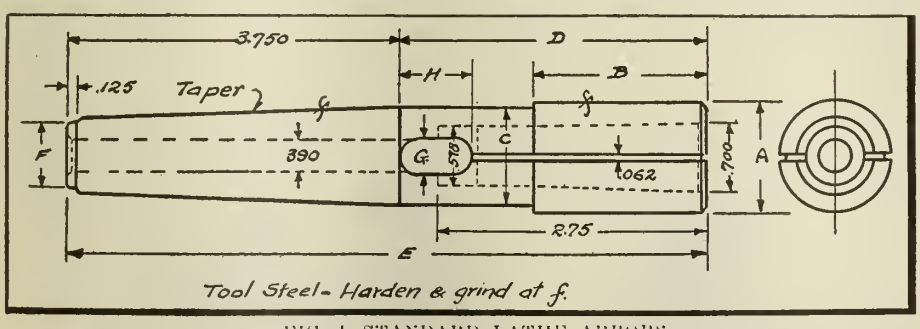

FIG. 4. STANDARD LATHE ARBORS.

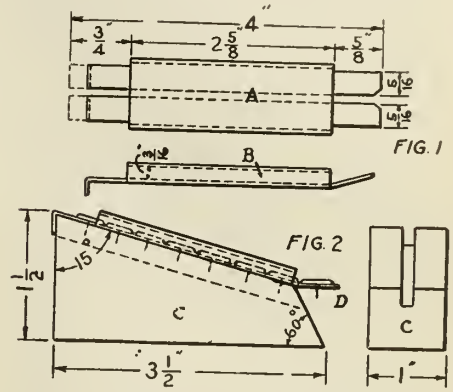

The expander is simply a plug of the required taper, as shown by table, and having a straight stem long enough to make the length, as given in table, allowing about ¼ in. of tapered end to project in order that the arbor may be tightened by striking with hammer. The arbor may be loosened by the use of the ordinary rod in common use to bump out centres. The big advantage that this type of arbor has over others is the fact that work can be removed without removing arbor from lathe.

I would like to say that the arbors in this drawing are used with LeBlond lathes, but could be used with any lathe with such changes of the fixed dimensions as may be necessary.

FIG. 4. TABULATED SIZES.

leases them from the paper, and holds them, ready for immediate use. In Fig. 1 is shown a piece of sheet-steel bent in the shape indicated, having one end filed, beveled for a claw. As seen, the tacks can be slid up the track (A) as fast as they are taken from the board. The point of the tacks already on the track in no way interfere, as they raise up when in contact with the board; the enclosed area (B) being high enough for this purpose. The inclined block (C), Fig. 2, is made of wood, and is used for holding the lifter when filled with tacks.

THUMB TACK LIFTER.

As illustrated, the tacks will slide down the incline, and can be picked off the step (D) as fast as wanted.

THUMB-TACK LIFTER.

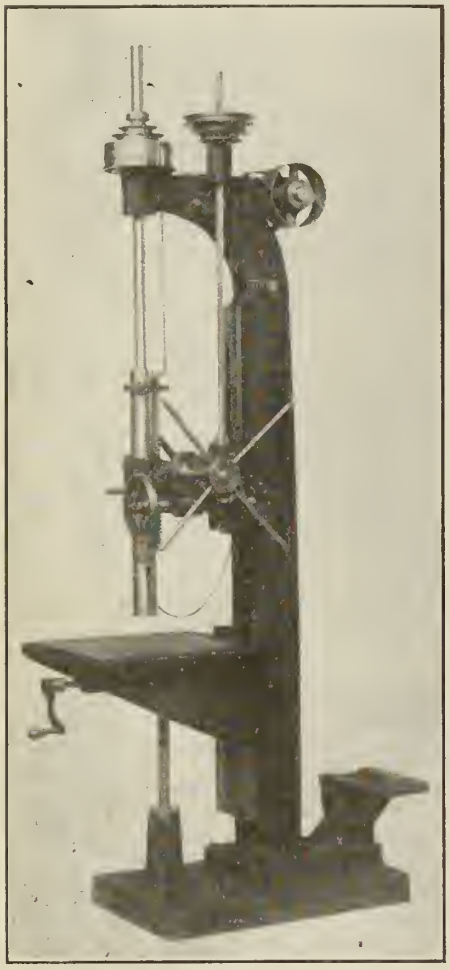
By James E. Cooley.

WHEN taking out thumb-tacks from a drawing-board they sometimes cling to the hole in the paper or roll off the board as the paper curls up. In the accompanying sketch is shown a tack-lifter that picks up thumb-tacks, re-

To Distinguish High-speed Steel.—Three kinds of steel are in general use for cutting tools, i.e., high-speed, self-hardening, and carbon. When they are unmarked, it is a puzzle to tell offhand which is which. Self-hardening can be distinguished by its always hard condition. High-speed can be told from carbon steel by grinding a little on an emery wheel. The sparks which it gives off are a dull red (much like those from self-hardening), and do not fly off at much of a tangent to the wheel, but keep close to it and die out quickly.—D.A.H.

Drilling Suggestion.—For clearing the cuttings out of a deep hole, or when starting the drill on a hole that has been marked off, most drillers blow off the cuttings with their mouth, or use a blow pipe, so that they can see if the drill is running true to the lines. A much cleaner and quicker method is to get an old round file magnetized. This will readily lift the cuttings from the deepest hole, a light tap on the side of the job dislodging them. When starting the drill it will pick up all cuttings and you can then see what the drill is doing.—J. Davis.

Winnipeg, Man.—The Manitoba Cold Storage Co., will build an addition to its plant.



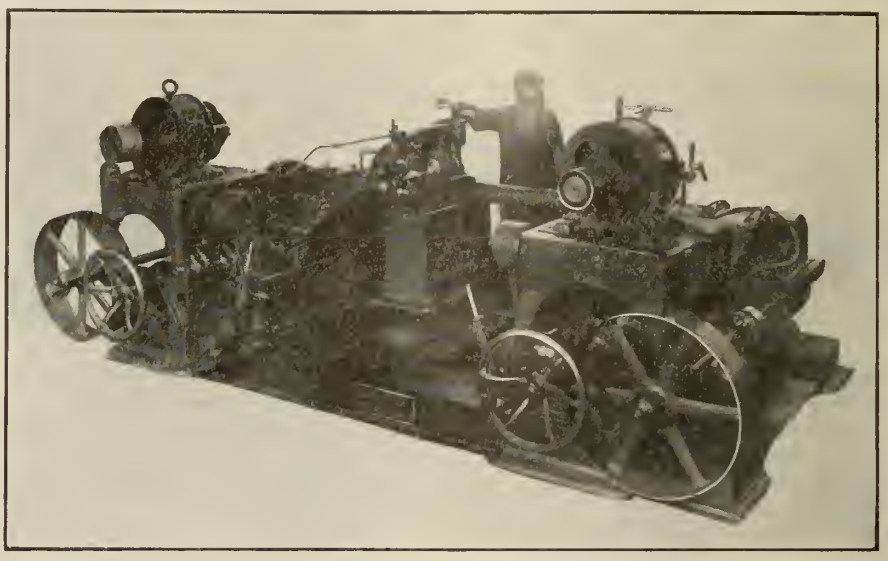
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

BALL BEARING HIGH SPEED DRILL.

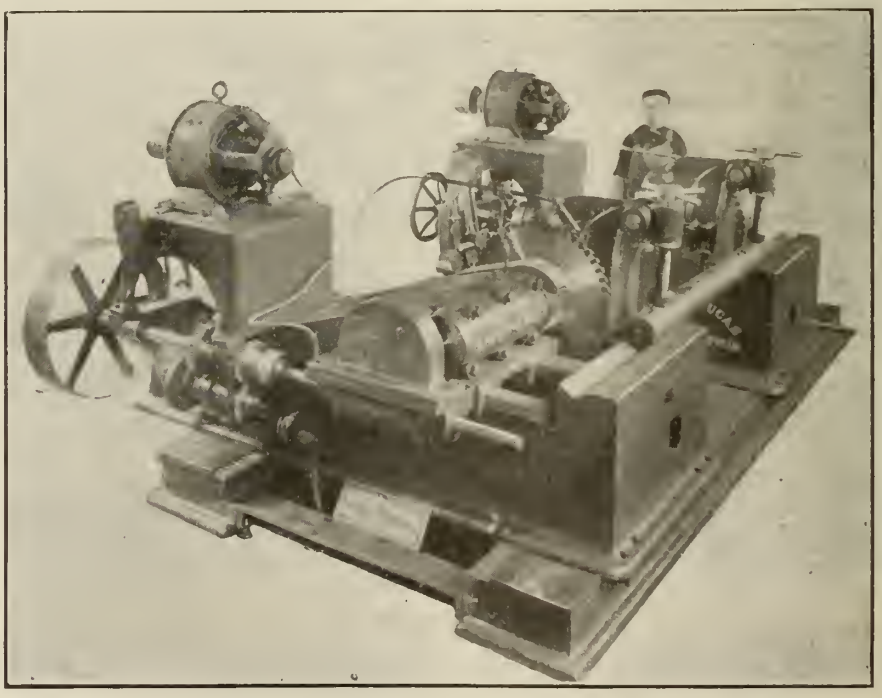
THE illustration represents a high speed drill equipped with both hand and power feed, 14 in. adjustment to the slide, 14 in. travel in the head, and 14 in. adjustment to the table.

A number of these drills were furnished the plant of the Fort Wayne Electric Works of General Electric Co., Fort Wayne, Ind., and were built to specifications furnished by their mechanical superintendent. These drill presses are designed for heavy duty work in driving multiple spindle drill heads of the Langelier and other similar types in which as high as eight 3/8 in. drills are required to operate simultaneously.



BALL-BEARING HIGH-SPEED DRILL.

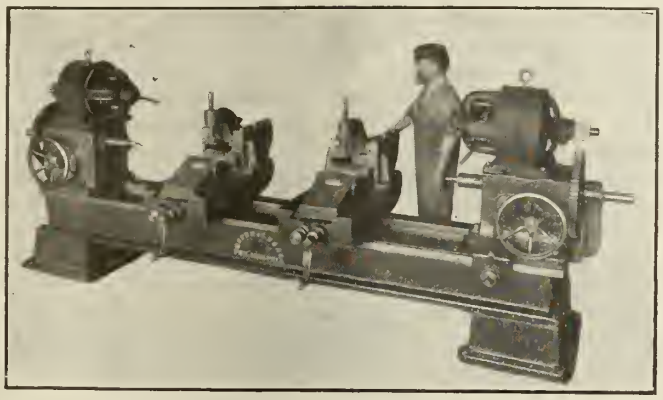
The machines are driven by a direct current "Fort Wayne" motor mounted on a bracket on the base. For the particular class of work for which these drills are to be used, a constant speed motor is used, driving the spindles at 1,800 r.p.m., but if a range of speeds is desired, a variable speed motor can be used, or the motor bracket can be replaced by a bracket supporting a cone pulley. Three feeds are secured through the feed cone pulleys on top of the machine, which are .005 in., .007 in., and pulleys are mounted on high grade ball bearings, and the spindle is supplied with a ball thrust bearing which reduces .010 in. per revolution of spindle. The friction to a minimum. The above drills were built by the Aurora Tool Works, of Aurora, Ind.



NEW COLD SAW CUTTING OFF MACHINE.

THE accompanying illustrations show a rapid production duplex cold saw cutting off machine intended for cutting off both ends of axles at one operation. It has recently been built by the Espen-Lucas Machine Works, Philadelphia, Pa.

The machine is equipped with two 26-



NEW DUPLEX COLD SAW CUTTING-OFF MACHINE—REAR VIEW.

DUPLEX COLD SAW CUTTING-OFF MACHINE—FRONT VIEW.

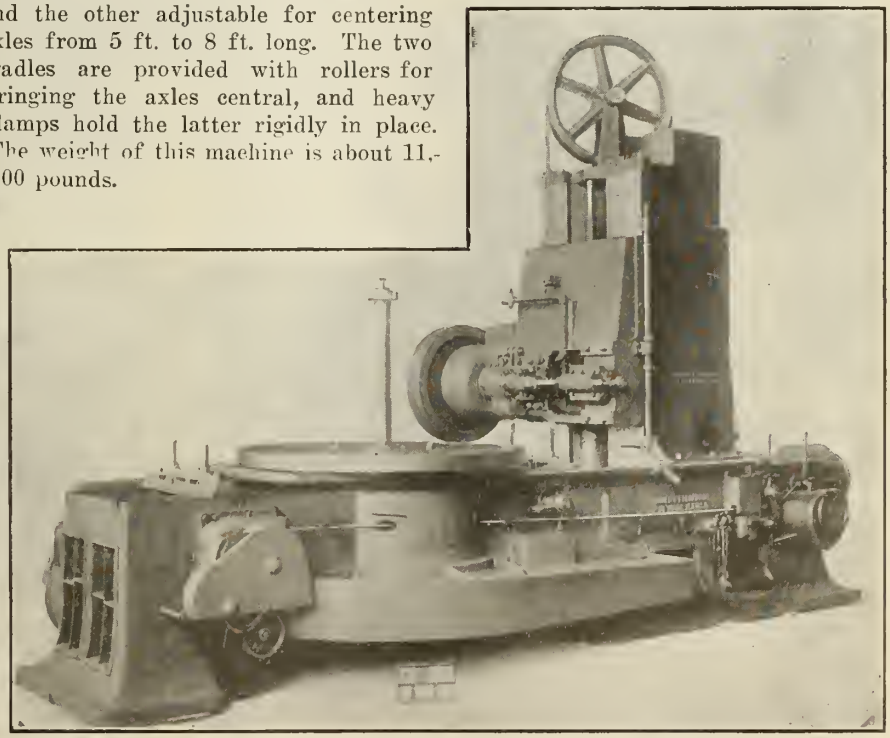
inch saw blades with special inserted teeth, and has a capacity for cutting off both ends of 7-inch axles at the rate of twelve to fifteen axles per hour. Feed and speed variations are provided that will permit of the machine sawing off materials at an advance of six inches per minute, though such a feed is not likely to be required in actual practice. The cutting capacity, it is stated, is limited only by the nature of the steel to be cut and by the endurance of the high speed steel in the cutters of the saw blades. This product is said to be the most powerfully geared and liberally proportioned machine of its capacity yet built. It is driven by powerful compound gearing, steel worm and bronze worm wheel. The main bed and table are heavy castings, reinforced with stiff webs, while the saw carriages are extremely wide and long, with ample bearing on the base.

DOUBLE END AXLE CENTERING LATHE.

The saw blades are bolted directly to the driving gears, and the latter are forged integrally with the ends of the spindles. This form of construction eliminates the development of torque or other lost motion between the saws and the gears, and gives a bearing for the spindle the full width of the saw carriages. This drive is claimed to be a great improvement over the old type, in which the driving gear was placed at the centre of the spindle, thereby developing torque and weakening the saw carriage.

All gears are cut, and together with the spindles, shafts, etc., are made from high carbon forgings, well hammered. All bearings are bushed with bronze, and the thrust of the driving worm and other rapidly-revolving parts is taken up by roller bearings. The feed is of the friction type, and is variable and automatic, being controlled by an automatic stop which regulates the depth of the cut up to the full capacity of the machine. The saw carriage is equipped with automatic power return and automatic starting device. That is to say, the feed can be adjusted so that as soon as the saw has cut through the axle, it returns to the beginning of its travel and then commences to advance again, thus leaving the operator free to give his whole attention to feeding axles to the machine and removing them when finished.

A copious flow of cutting compound is directed on the saw teeth during operation by two circulating pumps, and the axle is held down in place by two pneumatic clamps. Each saw is independently driven by a 15-h.p. motor, and the total weight of the machine is approximately 30,000 lbs. The Canadian Fairbanks-Morse Co. sold one of these machines to the Canadian Car & Foundry Co., who have installed it in their new plant at Fort William, Ont.



After being cut off in the foregoing machine, the axles are centered in the double end centering machine illustrated. This was also built by the Espen-Lucas Machine Co., and has a capacity for centering axles up to and including 7 inches in diameter by 8 feet long. The machine is arranged with two spindles independently driven by two 2-h.p. motors. One head is stationary and the other adjustable for centering axles from 5 ft. to 8 ft. long. The two cradles are provided with rollers for bringing the axles central, and heavy clamps hold the latter rigidly in place. The weight of this machine is about 11,000 pounds.

NEW LARGE AUTOMATIC GEAR CUTTING MACHINE.

GOULD & Eberhardt, Newark, N. J., have built for Foote Bros., Chicago, a large gear cutting machine, and will cut spur gears up to 144 inches diameter by 24 inches face. It has capacity for cutting steel gears up to 4 inches circular pitch. This machine is of the vertical cutting type and, owing to the very heavy gears for which it was designed to cut, the indexing worm wheel is mounted in a fixed position and the stanchion carrying the cutter slide is adjustable by hand or power to accommodate different diameter gears and for setting the depth of cut.

The cutter spindle is driven by a powerful worm and worm wheel, with a heavy fly-wheel mounted on the end of the main spindle. The cutter arbor is 3 inches diameter, and will take cutters up to 14 inches diameter. An auxiliary cutter spindle is also furnished. It is driven through hardened helical gears from the main spindle. Cutters of ordinary dimensions may be used and a great variety of sizes from small pinions to the largest gears, may thus be handled. The machine is entirely automatic, and has many of the features of the firm's well-known smaller machines. A wide range of cutter feeds and speeds is provided, and the cutter feeds which are independent of the speeds may be conveniently changed through an improved gear box.

The indexing worm wheel is of the split rim type, extremely and accurately hobbed. The indexing and feed mechanisms are connected with a system

NEW LARGE AUTOMATIC GEAR CUTTING MACHINE.

of interlocking levers so arranged that it is impossible for the feed clutches to engage until the indexing has been completed and accurately performed. A system of oil pans completely cover and guard the worm wheel and keep the floor clean, while a large oil pump provides a generous flow of cutting lubricant to the cutters. The speed of the indexing wheel may be varied to suit various size gears.

The machine is also arranged so that worm wheels may be hobbed automatically from the solid without previously gashing the teeth. The cutter spindle is geared in unison with the indexing worm, and single or multiple thread hobs may be used with equal facility. The cutter slide may be locked securely in any desired position for hobbing, and an automatic feed, gradually feeds the hob into the wheel. The weight of the machine is about 35,000 lbs.

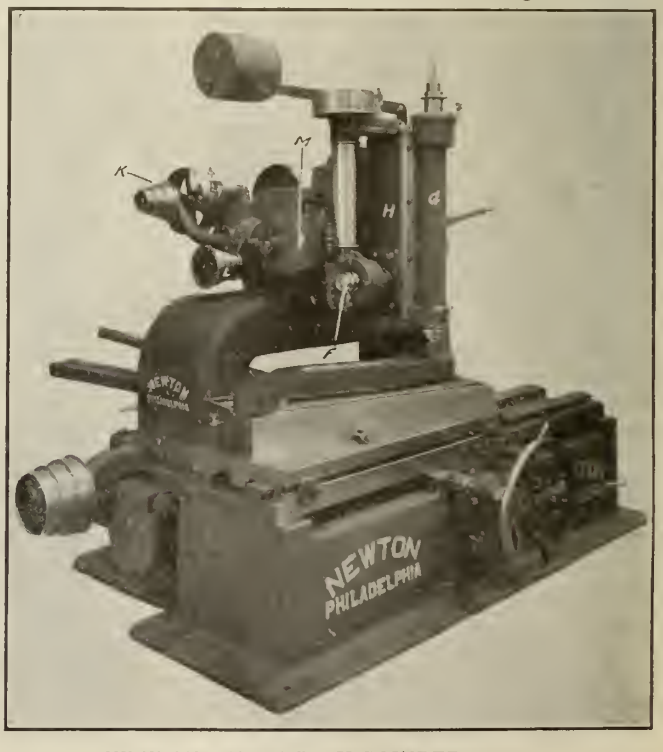
NEWTON RADIUS LINK GRINDER.

THE Newton Machine Tool Works, Philadelphia, Pa., have recently added to their standard machine tool designs and products the Radius Link Grinder here illustrated. Its construction was the result of a call by a large firm of locomotive builders for a machine capable of grinding the hardened radius links which are now required to meet the exigencies of service conditions. The original machine is known as an 11,000-pound Radius Link Grinder, and is now in successful operation.

Investigation showed that the links had faces to be ground in different widths up to 5 in., and, while the latest designs with the widest faces permitted of the use of large diameter grinding wheels, the older types had only 1 in. of clearance at the end of the radial surfaces for clearance. This necessitated grinding wheels 2 in. or less in diameter, and as such wheels compelled the use of small diameter arbors to carry the emery wheels, it was deemed unwise to figure on grinding the entire width of face at all times, as was done on the larger sizes. The small diameter wheels are, therefore, made only 1-in. face for ¼-in. feed at each stroke, and the entire width of face is covered by a continuous vertical feed to the main spindle saddle. When using the large diameter wheels, the auxiliary saddle has a reciprocating feed of about ¾ in., to insure even wear on the wheel to give a parallel surface.

In actual operation the links are located on the fixture mounted on the top table by suitably located pins. The radius, gauged at all times from the centre of the link to the centre of the pivot (B), is measured by the scale (C), and the maximum capacity is for links up to 100 in. radius, and of approximate length of 42 in. To insure maintaining central location of the work table while changing the radius for the various size links, pins (D) mounted on both ends are temporarily inserted in hardened steel bushings in the cross slide (E).

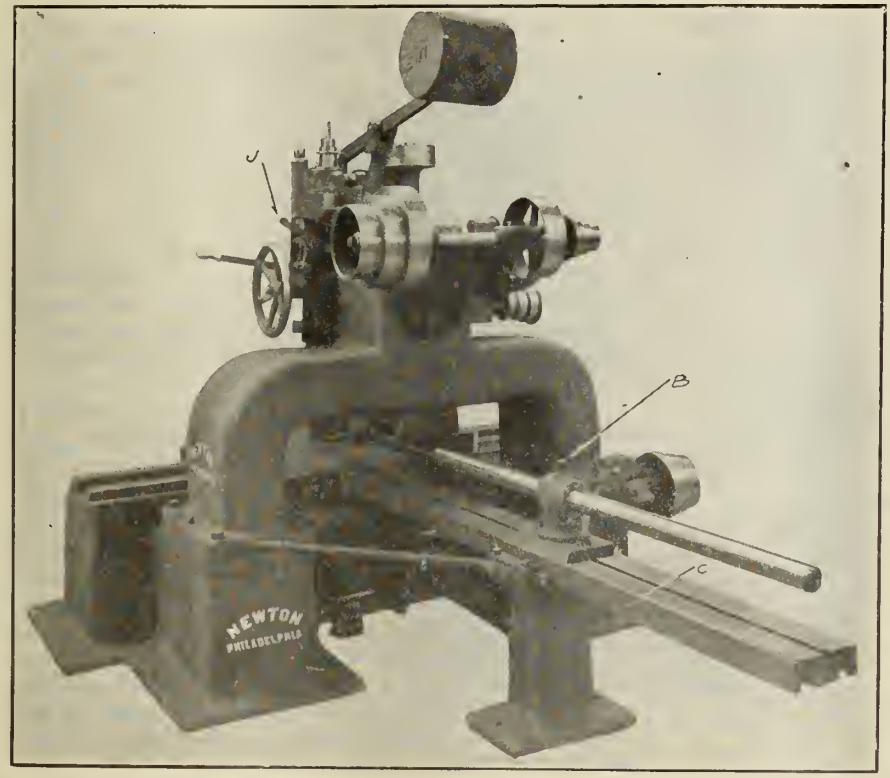
After setting the link, the machine is started, and the hand-operated clutch (F) controlling the reciprocation of saddle (G) is engaged. The main saddle (H) is then lowered by means of the wheel (I) until the emery wheel bears the proper relative position to the face to be ground. During the operation the main saddle feed is made inoperative through the latch lever (J), which holds the feed-operating clutch neutral.



When the small diameter narrow face wheels requiring the feed are used, the reciprocation clutch (F) and the neutral feed latch (J) are disengaged; then the constant feed to the main saddle (H) is operative. Motion for this feed is taken from the feed cone (K) on the main driving shaft to (L), and through the double train of bevel gears in the box (M) to give the levers motion. The length of feed is controlled by the trips (N), which are so arranged that when the extreme length of travel up or down has been reached the direction of movement of the saddle is automatically reversed, and to eliminate undue dwell at the end of the stroke a spring roller latch is incorporated at (O).

After properly locating the grinding wheels, the trips (P) on the cross slide are adjusted for the length of the travel. These engage pawl (Q), the action of which is to reverse the direction of travel, and is quickened by a spring roller latch. Lever (R) mounted upon the shaft with trip (Q) permits of stopping the table at any desired point, and lever (S) controls the neutral latch for the table traverse mechanism. Hand wheel (T) in the position illustrated controls the in-and-out adjustment of the bottom saddle (U) for depth of cut, and when fitted onto the square end of shaft (V) hand cross motion of the slide (P) is possible.

To permit the work table (W) to follow the radius being ground, the table



NEWTON RADIUS LINK GRINDER.

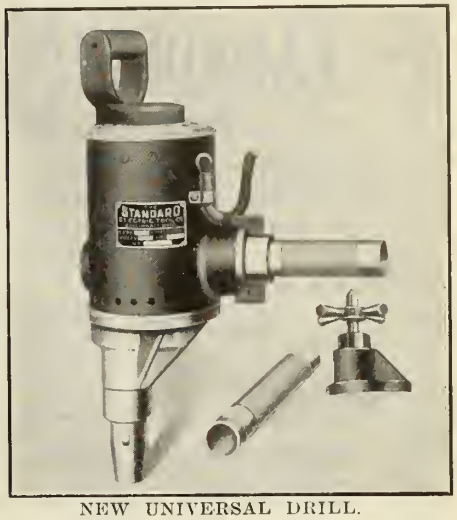
NEWTON RADIUS LINK GRINDER.

clamp (X) is pivoted to the cross slide (P). As the radius bar (Y) is attached directly to the slide (U), adjustments for depth of cut and from side to side of the links are made without disturbing the radius, and also, without re-setting the work, parallel radii are ground. With this design beyond clamping the work on the table and adjusting for depth of cut, and from side to side of link, all operations are automatic. The main drive for the countrshaft is received at pulley (Z). The spindle of the machine varies from 2⅛ in. to 2¼ in. in diameter, and is supported with self-centering ball and taper roller bearings with take-ups, which arrangement eliminates any possible wear of the spindle. The spindle speeds range up to 5,000 r.p.m. per minute. As shown in the

NEWTON RADIUS LINK GRINDER.

photographs, proper counterweighting is provided for. On account of the difference in weight of the saddles (H) and (G), the connecting of the one weight to each of these has been made through a horizontal compensating link.

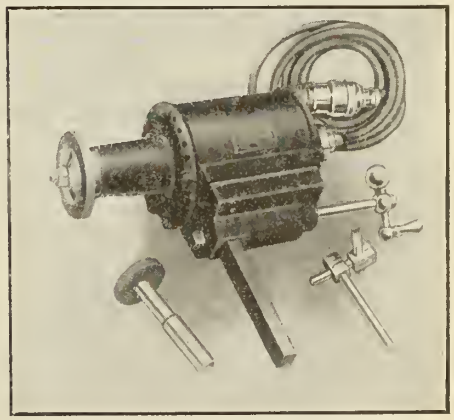
Since watching the operation of this machine, the makers are considering the exhibition of a duplicate at the Master Mechanics and Master Car Builders' Convention this year, if unforeseen conditions do not prevent.



The Canadian-Allis Chalmers, Ltd., Toronto, have been appointed sole agents for Canada and Newfoundland, for Avery's, Ltd., Birmingham, Eng., scale manufacturers.

NEW UNIVERSAL DRILLS AND GRINDERS.

THE Standard Electric Tool Co., of Cincinnati, Ohio, have developed and are now placing on the market a new line of portable electric tool post grinders. These operate on both direct-current and alternating-current, 0 to n0 cycles, being developed particularly to meet the demand for operation on 25, 30 and 40 cycle circuits. The grinders are ball-bearing and are encased in dust-proof chambers packed in grease. This eliminates oiling, and prevents flooding with thin oil and damaging motor windings, as well as precluding the possibility of trouble from improper bearing adjustment. These tools are manufactured in 1-6 and ¼-h.p. sizes, and they have a speed of approximately 6,000 r.p.m., which makes them very effective for internal grinding.



In addition to the above grinders the company are placing on the market two new sizes of Universal drills, ⅝-in. and 1-in. capacity. These are in addition to the seven sizes they have had on the market for some time and which were illustrated and described in these columns at an earlier date. The drills operate on both direct and alternating current, 0 to 60 cycles, and as with the grinders are especially adapted for 25, 30 and 40 cycle circuits. Drills are ball-bearing throughout. The ⅝-in. size is fitted with No. 2 Morse taper socket or with chuck, and the 1-in. size with No. 3 Morse taper socket. Gears are generated from a special grade of steel and are case-hardened, and run encased in grease.

Motors in both grinders and drills are form wound and are impregnated in Bakelite, which method of winding and insulation prevents grounds, short cir-

NEW UNIVERSAL DRILL.

cuits and other troubles incident to high speed apparatus if constructed according to slow speed motor practice. All tools are air-cooled by means of a high power fan. These motors are capable of overload without damage. The idea of simple rigid construction has been followed throughout, although weight has

NEW UNIVERSAL GRINDER.

been kept down to the minimum. Both drills and grinders are built on the unit plan, which makes them easily dismembered. All electrical connections are made in the frame unit.

The ⅝-in. and 1-in. sizes of drills have also been added to their line of drills for direct current only, as well as for two and three phase alternating current.

Ask $13,748 From C.N.R.—The Canada Iron Corporation, Limited, and the Montreal Trust Co., and Edgar McDougall, liquidators, have entered action at Osgoode Hall against the Canadian Northern Railway Co., to recover $13,748.01, alleged due for goods sold and delivered.

PRICE CUTTING IN THE FOUNDRY.

THE present money stringency has brought with it a great many results, most of them characterized as evil though they may not be without a grain of good. If money be scarce and more expensive, other commodities must necessarily be cheaper when compared with it, and naturally, the first prices to fall are those in connection with the production of the elementary commodities, among which those of the foundry are, by no means, the least important. From the manufacturer's point of view, it seems only fair that the price of labor or the price of his production should adjust itself to the variations of the standard—money.

Price cutting must be distinguished from cost cutting in that it refers particularly to the piece-work prices paid the moulders and not the cost of melting, supplies and overhead charges. The necessity of this reduction should, theoretically, be as frequent as the possibility of a general rise in wages, and, if tact and judgment coupled with fairness be applied, the undertaking will be robbed of many of its disagreeable features.

Price cutting naturally divides itself into two general classes. First: that which is accomplished by simply reducing the prices to the moulder and which proportionately reduces his remuneration. This may be occasioned by "hard times," an unreasonably high price being paid for the job in question, or the selfish desire of the foreman for notoriety, or the manufacturer for increased profits.

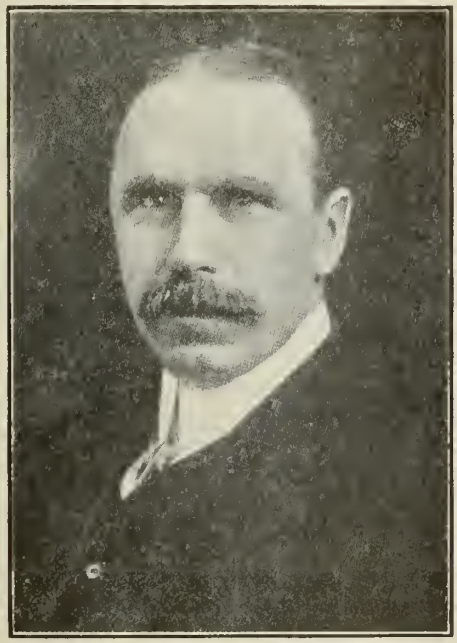
Second, that which is brought about by reducing the mechanical effort required of the mechanic, making it possible for him to produce more, and thus lower the quantitative cost. This has many advantages in that it often decreases the wear and tear of tools and appliances, and decreases the quantity of materials required. It is also nearly always more satisfactory to the moulder himself.

If a cut in prices be deemed necessary, it should go into effect upon starting the job after it has been for some time out of the sand, or, if it be possible to change the job from one method of moulding to another, even though the actual labor of production be not decreased, it can be classed as a new job with a "new" price without seriously antagonizing the operative. When, however, the production depends largely upon long practice of the moulder at that particular piece, or it is impossible to change or improve the method of moulding, and a direct cut is required, the duty of communicating this fact to the workman should fall to the lot of the superintendent and not to the foreman as is usually the case.

In securing a lower price by the indirect method of reducing what might be termed the moulder's cost, some general considerations should be first thought out. The production of more castings requires that the moulder must handle more iron, and this is usually the most fatiguing of his day's work. An important thing, then, is to arrange the plant and install appliances so that the iron can be gotten as cheaply, as hot and as conveniently to him from the cupola as possible. The means adopted of course, depends very largely upon the class of work, whether small or large. The shaking out, cutting of the sand, etc., can and should be accomplished with the employment of cheaper labor which, in some plants, is successfully handled on a piece-work basis.

The writer has found in a varied experience that one of the great obstacles to the reduction of prices exists in imperfections of the patterns and machines. A "rat" or a badly fitting core may often be the cause of more discouragement and dissatisfaction on the part of the moulder than a cut in wages. The moulder himself, if encouraged will often prove a valuable assistant in the devising of cheaper methods of production and, if paid cash for his successful ideas, will often call attention to possible economies in other work than that in which he is directly engaged.

Finally, the cutting of prices in the foundry should not be done in the office by officials who cannot be expected to have a knowledge of the work, methods, and processes involved, nor yet can it be well done by the foreman, whose intimate contact with the men demands that he be more or less in sympathy with them. This necessary work should form part of the duties of a superintendent or master mechanic whose chief recommendation to the position should be a thorough mechanical knowledge coupled with a sense of fairness and strength of character that will retain for him the respect of the men whether they suffer or benefit by his decisions.



INDUSTRIAL NOTABILITIES--No. 27

W. H. CLARENDON MUSSEN, President of Mussens, Ltd., Montreal, Que., the largest dealers in railroad, contractors', mining and municipal supplies in the Dominion, and identified with many other industrial enterprises, was born April 12, 1870, in Canada's metropolis.

He is a son of Wm. Whitehead Mussen, for many years in the dry goods business, and of Georgianna Victoria (Hurlburt) Mussen, of Cobourg, Ont. The family on both maternal and paternal sides were pioneers in civic business and political affairs, and long prominent in Canada.

After leaving the Montreal High School at the age of 16, the subject of our sketch accepted a minor position with the old established firm of Cooper Fairman & Co., railway supplies, etc., at Montreal, and finally became traveling salesman. In 1889 the Cooper Fairman firm was changed to that of James Cooper.

In 1901 Mr. Mussen decided to embark in business on his own account, and on June 15 of that year, established the firm of W. H. C. Mussen & Company. In 1906, the change of name to Mussens, Limited, took place, and he became president and gen-

W H. CLARENDON MUSSEN.

eral manager. The firm deals in railroad, contractors', mining and municipal supplies, and is the most important in these lines in Canada, having branches and warehouses located at Toronto, Cobalt, Winnipeg, Calgary and Vancouver.

Mr. Mussen is a director of Marsh & Henthorn, Ltd., Belleville, Ont.; a director of The Meaford Wheelbarrow Co., Meaford, Ont.; a director of the Ideal Concrete Machinery Co., London, Ont., and other enterprises.

He is greatly interested in club and athletic life, and is a past president of Montreal Thistle Curling Club; a past president Lachine Boating and Canoeing Club; a member of Montreal Curling Club, Montreal Jockey Club, St. James Club, Engineers Club, Canada Club, Royal Montreal Golf Club, Beaconsfield Golf Club, Country Club, Royal St. Lawrence Yacht Club, Montreal Amateur Athletic Association, St. George's Snow Shoe Club, Automobile Club of Canada, Canadian Society of Civil Engineers, Canadian Manufacturers Association and Montreal Board of Trade.

Mr. Mussen, whose residence is in Montreal, was married on April 28th, 1903, to Mima Linton Sharpe, daughter of Edward Shaw Sharpe of Montreal, and they have one daughter, Mary Eddeline Mussen.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., March 23, 1914.—Although stockbrokers like it to be thought that the rise and fall of the stock market provides an infallible barometer by which to judge trade conditions, such is not always the case. Just at present trade is not so bad as the price of stocks would seem to indicate, and a gradual improvement is noticeable in most lines. This does not hold good of metals, however, the pig iron market in particular being very dull.

The coming summer will see considerable development in industrial circles in Montreal. Mr. M. J. Butler returned from England to-day and stated that the large plant of Armstrong, Whitworth & Co., of Canada, across the St. Lawrence at Longueuil, would be put into operation at the earliest possible date. The actual date really depends on the various firms who are supplying the equipment, but it is expected that the shops will he opened about the end of June or early in July. Most of the equipment is being purchased in Canada, a good example, which is not being followed by the Canadian Vickers Company. The latter are bringing over practically all their machinery from England.

The Vickers plant at Maisonneuve is rapidly assuming a more finished appearance. The pile-driving is nearly completed, and most of the shops have been erected. Then, too, the new mill of the Canadian Rolling Mills, Ltd., will be completed early in the coming summer.

Another large factory now going up is that of the Northern Electric Co. This will have a floor area of no less than 1,000,000 square feet when it is eventually completed, though the section now being built is only half this size.

There is a movement on foot to ask the Government to enlarge the old Tate dry dock, now operated by the Montreal Dry Docks & Ship Repairing Co., Ltd. Lake vessels of large size can at present be docked only in the "Duke of Connaught" floating dry dock of the Vickers Co. The cost of operating this dock makes its charges for accommodation somewhat higher than lake vessels are inclined to pay; hence the Montreal Board of Trade would like to see the Government enlarge the Tate dock so that it would take any vessel capable of passing through the Welland Canal. The Montreal Dry Docks and Shipbuilding Co. are quite willing to pay interest on the cost of the work, and it is hoped that the project will go through.

Toronto, Ont., March 24, 1914.—The general conditions of the market remain substantially as reported last week; the volume of business has not shown any perceptible increase and the conditions governing the situation have not changed. Perhaps the most interesting feature to be noted since our last report has been the annual statement issued by the Canadian General Electric Co., Ltd., which may be regarded as being very satisfactory considering the conditions which prevailed during the latter months of 1913. The amount of work on hand at the end of last year was considerably more than at the end of the previous year, although some of this increase may be accounted for by the taking over of two other plants during 1913. The satisfactory results obtained by the company, whose policy is distinctly conservative, should instil a feeling of confidence among manufacturers during the coming season. Last week the Polson Iron Works received an order for a large car ferry, and this together with other work on hand will keep the company busy throughout the year.

In the machine tool business the volume of trade seems to be steadily increasing and dealers are becoming more optimistic. Orders being booked are more numerous and inquiries are coming in steadily, although to small specifications. The present uncertainty regarding the outcome of the financial requirements of the C.N.R. and the G.T.P., is having some considerable effect, but if these roads are successful in their appeals for funds it will have a beneficial effect on the tool and equipment business generally.

Prices for structural steel remain firm and conditions generally are quiet. We understand that the mills are endeavoring to force prices up but in the present state of the market it is doubtful if they will be successful. The market is quiet in the United States. but an improvement may be expected next month. With the return of favorable weather and the resumption of building operations there will no doubt be a buying movement, although perhaps only of a temporary character, with a permanent improvement later in the year.

Pig iron remains quiet, the demand being for small tonnages only. Only two Canadian furnaces are producing at the present time which indicates the low level demand reached. The recent order placed with the Dominion Steel Corporation by a Philadelphia firm, is an encouraging sign for Canadian concerns.

In the metal market, prices remain stationary with a fair amount of business.

Winnipeg, Man., March 21, 1914.—During the last few weeks there has been a marked improvement in the machine tool business, coming principally from small shops recently opened in the country. The custom is to erect a machine shop and garage combined in country towns, and these usually require drill, lathes, gas engine, etc., the cost of the equipment ranging from $800 to $3,000. Large manufacturers are not buying except in cases where they are in need of a particular machine.

The City of Calgary is at present in the market for about $10,000 worth of wood and iron machine tools for their municipal shops.

The Riverside Lumber Co. of Calgary, who are building additions to their

plant, are also buying a large amount of woodworking machinery.

Henry Birks & Sons, oue of the largest firms of jewelry manufacturers in Canada, who recently took over the business of Porte & Markle, Ltd., contemplate erecting a large plant here, and will no doubt buy a considerable quantity of machinery. The supply business has been fair right along, and has really been the salvation of the machine tool dealers this winter.

St. John, N.B., March 21, 1914.—The plan to develop electric power at Meductic, on the St. John River, is to be brought before the Legislature at Fredericton this week, and it is probable that theu the whole future of the project will be decided. The plan of the St. John River Hydro-Electric Co. would involve ultimately an expenditure of $3,650,000. The dam at Meductic would be twenty-five feet high from low water. The river here is between 700 and 800 feet in width. The amount cited in the foregoing would include the transmission line from Meductic to St. John, estimated at about 80 miles, together with transmission lines to Fredericton and Marysville and other stations. The initial development would be about $2,600,000, and other installations would raise the expenditure to the amount named. Manufacturers in St. John and other centres are greatly interested in the scheme to have power developed and delivered at a cost lower than formerly.

The steel work on the new post office in St. John will be completed shortly. The new grain conveyors to berths No. 5 and 6 at West St. John are about finished, and the gallery department staff of the John S. Metcalfe Co. are making preparations to send the plant back to Montreal.

Another new industry has been established in St. John, a large up-to-date plant for the production of aerated waters. The company operating the factory is known as the Blue Ribbon Beverage Co., under which they are registered at Ottawa. The new concern is in reality a large branch of the business of Hamm Bros., biscuit manufacturers, and they have erected their plant in Elm Street, north end. The new factory is already fitted with modern mechanical equipment. It is a large and well-planned building.

CANADIAN TRADE.

FIGURES of Canadian trade for the month of February, just issued by the Trade and Commerce Department, show a marked falling off in both imports and exports. The decrease in imports is no less than $14,401,754, or over twenty-five per cent. The decrease in exports of Canadian products, as compared with February of last year, is $2,304,080, or about ten per cent. This is the largest decrease in both imports and exports which has been reported for years, and is a significant commentary on the continued process of trade restriction which developed last year. Imports for the month totaled $38,550,045, as compared with $52,951,809 for February of last year. Exports of Canadian products totaled $20,553,087, as compared with $22,857,167.

Figures for Twelve Months.

For the twelve months ending with February, imports totaled $632,831,746, a decrease. as compared with the preceding twelve months, of $27,617,552. Exports for the twelve months totaled $463,626,532, an increase of $96,528,033. Exports of agricultural products increased by $66,000,000, and exports of manufactured goods increased by nearly $14,000,000. The total trade of the Dominion, including coin and bullion, for the twelve months was $125,833,306, an increase of $76,276,202, as compared with the preceding twelve months.

Trade Gossip

Laying Off Men. — Twenty men employed in the Michigan Central Railway yards at St. Thomas, Ont., were laid off indefinitely on Saturday last. The reason given was that economy had been ordered from headquarters.

The Dominion Machinery Co., of 249 Victoria St., have moved their office to 82 Adelaide St. East., Toronto, where they carry a large stock of transmission equipment, also a number of hydro electric motors from 1 to 30 h.p.

Norton, Callard & Company, have opened an office at 4 Hospital street, Montreal, as manufacturers' agents. They represent Joseph Cookson, Ltd., Manchester, Eng., manufacturers of cotton waste, and J. H. Gautier & Co., Jersey City, N.J., manufacturers of gas retorts, etc.

The Dominion Machinery Co., 82 Adelaide street, east, have been appointed agents for the Frankfort furnace, manufactured by Strong, Carlisle & Hammond, Co., Cleveland, Ohio, and for the "Corona" high speed ball bearing drill, manufactured by Wright & Wood, Ltd., Halifax, Eng.

Peebles Motor Converters for Canada.—Bruce Peebles & Co., of Edinburgh, Scotland, have just received the following orders for their well-known motor converters (Peebles-laCour patents):—Armstrong, Whitworth & Co., Ltd., Longueuil, Que., two 350 k.w. sets; Canada Cement Co., one 250 k.w. set. The Armstrong, Whitworth order includes various switch gear, etc.

Business Absorption.—The business of the Tungstolier Co. of Canada has been taken over by the Canadian General Electric Co., Ltd., Toronto, etc. It is the intention to carry in stock a large assortment of electric fixtures for both commercial and residential lighting, and the Canadian General Electric Co. being equipped with an up-to-date fixture factory, will be able to give the very best service in this respect.

Westinghouse, Church, Kerr & Co., Montreal and New York, have been retained by the Canadian Pacific Railway as engineers to investigate the matter of the proposed electrification of the new double-track, 5½-mile Selkirk tunnel, in British Columbia. The investigations will cover in general the particular system to be installed, the relative economies of steam and water power, and the effect of the electrification upon operating conditions.

The Smart Turner Machine Co., Hamilton, Ont., have recently supplied the following equipment: The Deloro Mining and Reduction Co., Deloro, Ont., power vacuum pump; the Great Lakes Dredging Co., Port Arthur, Ont., vacuum pump; W. H. Batt, Charlottetown, P.E.I., combined air and circulating pump; the Western Construction Co., Courtright, Ont., centrifugal pump; Barfelt & Co., London, Ont., centrifugal pump; the Canada Sugar Refining Co., Montreal, duplex pump; the Goderich Lumber and Milling Co., Goderich, Ont., duplex pump; the Hinde & Dauch Paper Co., Toronto, triplex power pump.

Stamping Wheel Tires—Now that tires for the wheels of locomotives and other railway rolling stock are turned out in much larger numbers than was formerly the case, the old method of putting the necessary mark on by hand has become too slow an operation for modern requirements. A method of stamping at one operation by hydraulic pressure has been tried, but the continuous pressure necessary has been found to distort the tires. To overcome these difficulties, the Kalker, Werkzeugmaschinenfabrik, Breuer, Schumacher & Co., of Kalk, Cologne, have recently brought out a special steam tire-stamping hammer, which is operated by a single lever, and, it is claimed, enables the tires to be stamped both rapidly and effectively.

HEATING BUILDINGS USING CENTRAL STATION CURRENT.

By William Kavanagh.

THE installation of an electrically operated vacuum pump in conjunction with the heating system of a modern building using central station current for power and lighting purposes will lessen fuel expenses incurred during the heating season of each year.

The Vacuum System.

The most economical system of heating is known as the "vacuum system." Its installation involves the maximum cost, but its operation will be found to reduce heating expenses 25 per cent. over that of other known methods of steam heating. When the vacuum system of heating is properly installed, it will require the least amount of attention, and cost for maintenance will be reduced to the lowest possible degree. The employment of the electrically driven vacuum pump places the most economical system of heating within the range of any building not so equipped. The electrically operated vacuum pump has the great advantage of not requiring steam pressure for its operation, hence it can be seen that the pressure carried on the boilers may be reduced to that of the atmosphere; a desideratum tending towards economy of fuel.

Steam at atmospheric pressure has a sensible heat temperature of 212 degs. F., and a latent head capacity of 966 degs. F., therefore the total heat in 1 lb. of steam at atmospheric pressure will equal 1178 degs. F. If our system of heating is such as to rapidly convey away the water of condensation, and assuming the temperature of the returned water at 200 degs. F., then the total extraction of heat from 1 lb. of steam will equal 987 degs. F. From this we learn that all of the latent heat has become sensible heat by reason of condensation, and its useful effect has been realized in the heating of the building employing the vacuum method of heat circulation. In order to obtain such economy, it is absolutely necessary to have the radiators and piping free of air and water of condensation, but such a condition can only be had when the vacuum pump is employed.

Buildings equipped with the single and double pipe systems, warm air and forced circulation of hot water cannot approach in the matter of fuel economy those having the vacuum system installed. Incidentally, it should be mentioned that the attachment of the electrically operated vacuum pump to the pipe systems above mentioned will convert them into that of the vacuum system, involving only slight changes in the piping.

Vacuum System Advantages.

The vacuum system has many advantages over all other methods of steam heating, some of which may here be mentioned.

The low pressure carried on the boilers precludes all possibility of rupture or accident which are inherent in the systems using high pressure steam or forced water circulation.

In the vacuum system, the liability of leakage is remote; quietness of heat circulation is attained, and the heating effect is rapid, positive and equal over the entire plant. Such advantages are not within the scope of the other systems.

Miscellaneous Heating Systems.

The single pipe plan of heating is of two kinds, known as the "free" and "air valve" systems. In the free system, the air valve which is attached to the radiator is in turn connected to a pipe which is open to the atmosphere; the object being to facilitate heat circulation by permitting the entrapped air in the system together with the water of condensation to escape freely to the atmosphere. With the "closed or air valve" system, the air valve attached to the radiator is not connected to any other pipe, but is supposed to automatically perform the functions necessary to permit the steam to traverse the heater, and thus the dissipation of heat in the radiator is obtained.

The warm air system involves the use of a fan driven by some source of power. The fan discharges cool air through a bank of pipes containing steam, the warmed air being then conveyed through ducts conveniently located for the purpose of heat distribution.

Heating by means of warm water is accomplished in either one of two ways; one is known as "free circulation." With the other is that of "forced circulation." With the free circulation plan, advantage is taken of the gravity of the ascending and descending columns of water, thus obtaining an automatic circulation. With the forced circulation, a pump is used to circulate the heated water throughout the system, such circulation being continued as long as heat is required.

Heating by means of the electric current will materially reduce the cost, and more especially during the fall and spring months of each year. The electric current is extensively used for the heating of offices, baths, sleeping apartments, hospitals, etc., and when current can be obtained at a reasonably low figure, its continued use will be found to give satisfactory results owing to its adaptability to varying temperatures, non-vitiation of the atmosphere, cleanliness and simplicity of installation; all of which advantages combine to make it a superior media for the purpose.

From what has been said it can be seen that the maximum economy in the heating of a building cannot be obtained when fuel must be burned in order to force a circulation of steam through the heating system. Under the conditions where air can enter the piping and radiators and the water of condensation is not removed with sufficient rapidity, an unnecessary expenditure of fuel is required to overcome the resistance offered by the presence of these bodies. The employment of the electrically or steam driven vacuum pump eliminates such resistance and reduces the cost of fuel to the lowest possible degree.

6,235,000 TONS OF COAL MINED.

THE total tonnage of coal mined in Nova Scotia during the past year is the largest ever recorded, amounting to 6,235,000 tons as compared with 5,815,000 tons the year before. Of this total the Dominion Coal Company produced 75 per cent., its output for the year amounting to 5,000,000 tons.

While this production exceeds that of former years, it is far from being the capacity of its collieries, as the year's output was curtailed by lack of labor and market. The two other large producers of coal in this region are the Nova Scotia Steel & Coal Co., and the Inverness Coal & Railway Co.

The following table gives a comparison of the output in tons of the principal companies operating in this district for the years 1912 and 1913:

	1912.	1913.
Dominion Coal	4,500,000	5,000,000
Nova Scotia Coal ..	850,000	850,000
Inverness Coal	300,000	300,000
Colonial Mining ...	35,000	35,000
Mackay Mining	30,000	30,000
Nor. Atlantic Coal..	100,000	
Cape Breton Coal..		20,000
Total	5,815,000	6,235,000

The North Atlantic Coal Co. does not appear as a producer in 1913, it having been added to the Dominion Coal Co.'s properties.

Overcoming Belt Troubles.—"How a central station can overcome its belt troubles," is the name of a pamphlet just published by the Cling-Surface Co., Buffalo, N.Y. The matter contained in its pages will prove of much value to the engineer of any central station where belts are used. The slack belt is strongly advocated. Pictures of various kinds of drives are shown and technical information is given descriptive of each drive.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Welland, Ont.—The Welland Machine & Foundries, Ltd., will erect an addition to its factory.

St. John, N. B.—The Canada Nail & Wire Co., Ltd., will build a factory at Coldbrook near here.

London, Ont. — The Canada Grate & Supply Co., will erect a plant to manufacture a new type of grate bar.

Owen Sound, Ont. — The Northern Bolt & Screw Co., is having plans prepared for extensions to its factory.

Duncan, B.C.—The town have purchased a site on which to build a power house. A Deisel engine will probably be installed.

Goderich, Ont.— The American Good Roads Machinery Co., will make additions to its factory, to cost about $90,000.

Hamilton, Ont.—The Chadwick Brass Co., is looking for a site to erect a three-story building with machine shop, plating rooms, etc.

Transcona, Man.—G. S Van Westrum, vice-president of the Westrumite Asphalt Paving Co., is negotiating for a site on which to erect a factory.

Ottawa, Ont.—The foundry, owned by the Alee Bros., which was destroyed by fire some weeks ago has been rebuilt, and the owners expect to commence work shortly.

Dundas, Ont. — The Refractory Ores Converters, Ltd., of which company Mr. D. M. Cameron, of Hamilton, is president, have leased an existing factory here and will start operations as soon as possible.

Chatham, Ont. — It is reported that Mr. Hees, of the Drop Forge Co., who was considering the establishing of a factory on the old Defiance Iron Works property, will go to Windsor to meet the civic authorities of that place with a view to discussing a scheme to establish his factory in that city.

St. John, N.B.—T. McAvity & Sons, Ltd., will call tenders early this year for the erection of part of a large plant which they propose building here. A site covering 22 acres has been purchased, and an industry will be established for manufacturing iron and brass goods.

Electrical

London, Ont.—The city are in the market for a considerable quantity of electrical apparatus, including transformers, meters, poles, etc., for particulars apply the Hydro-Electric Commission.

Hamilton, Ont. — George F. Webb's east end incline will be running in a few weeks, it is said, and will be started with the old machinery if the new electrical equipment is not ready by the time the roadbed is. The company will spend, it is said, in the neighborhood of of $50,000 on new electrical machinery.

London, Ont.— Work has started on the new $32,000 building next the Horton street hydro station, which is to house the machinery necessary for the converting of power for the London Street Railway Co., and the electrified London and Port Stanley. Plans have been completed and submitted to Building Inspector A. M. Piper, and the necessary permit has been issued.

Municipal

Stratford, Ont.—The city will spend $15,000 on a fire engine, ladder truck and motor chemical truck.

Watford, Sask.—The town council has engaged Engineer W. H. Thorold, Toronto, to report on the cost of a waterworks system for the town.

Transcona, Man. — The town council are considering the erection of a pumping station and reservoir. A site is being selected. W. M. Scott is the engineer.

Windsor, Ont.—The Water Board is preparing for further expansion and is contemplating the installation of a new pump to safeguard the supply in taking care of the growth in population.

Sarnia, Ont.—The town council will act as a special committee while attending the radial meeting in Ottawa this week to urge upon the Government the need of an up-to-date harbor for Sarnia.

Point Grey, B.C.—The listing of industrial sites near Eburne, with full particulars as to cost of power, water and other requisites, was decided on at a meeting of the Point Grey and Richmond Board of Trade on March 9.

Chatham, Ont.—W. T. Shannon has been elected president of the Chatham Board of Trade; D. McLauchlin, vice-president; J. W. Plewes, secretary; W. C. Armstrong, treasurer, and C. J. Cummings, assistant secretary.

Kamsack, Sask.—Chipman & Power, engineers, Toronto, have been requested by the town council to prepare contracts and call tenders for waterworks, sewage system and an electric light plant. It is estimated that the new works will cost about $130,000.

Sarnia, Ont.—Sarnia has inaugurated her publicity policy, and as a result of the first day's canvassing the committee of the Board of Trade have secured $3,000 in cash to help on the work of getting new industries, and to advertise the town.

Windsor, Ont. — On motion of Ald. Howell, the whole council was empowered to represent the city on the waterways deputation that will wait on the Dominion Government at Ottawa on March 26 and urge the development of the St. Lawrence route so that ocean-going vessels may reach the inland ports along the great lakes.

Toronto, Ont.—A special meeting of the Works Committee was held last Friday to consider the report of Commissioner Harris, who recommends a waterworks plant at Victoria Park, which will be of sufficient capacity to supply the whole city in an emergency. The filtration bed would handle 120,000,000 gallons per 24 hours and the pumping plant would give a flow of 60,000,000 gallons per 24 hours, which could be doubled by increasing the plant. The estimated cost is $6,033,700. In January, 1913, the ratepayers authorized an expenditure of $6,677,000. The surplus, $643,300, would meet debenture discount and financing.

Building Notes

Montreal, Que.—J. A. Benoit, architect, has in hand plans for a $150,000 convent school to be erected by the Catholic School Commissioners of Verdun. Another school is under contemplation by the Christian Presentation Brothers, at Lachine.

Windsor, Ont.—The Windsor Power Building Co., will erect the new factory building on Caron avenue and Sandwich

street, at a cost of $80,000. It is expected that the Toledo Scale Co., of Detroit, will occupy part of the structure.

Regina, Sask.—To judge from the permits issued so far this year, it appears that no very great amount of construction is being planned at Regina just now. The value of structural work amounts to $66,750, nearly $200,000 less than for the corresponding two months of 1913.

Montreal, Que.—Three garages will be erected by the Autobus Co., each to be a three-storey concrete structure, to cost between $40,000 and $75,000 each. The sites are already secured or under option, states Mr. U. H. Dandurand, but the company is not yet ready to announce the locations.

Welland, Ont.—A slight advance in the value of permits for February is reported from Welland, the figures being $14,424 as compared with $12,425 for the same month last year. From the 1st of January the amount involved in building operations totals $20,536, which sum is seven thousand dollars less than in 1913.

Redcliff, Alta.—The Spalding Co. Ltd., of Medicine Hat, are advertising bids for the erection of a large warehouse here. The contract will probably be let within a few days, and erection will be commenced shortly thereafter. The size of the building will be 40 x 75 feet, solid brick construction, two storeys high.

Calgary, Alta.—The Gutta Percha & Rubber Co., Ltd., with headquarters in Toronto, will start within the next few weeks the erection of a fine warehouse on the north side of Eleventh avenue. The warehouse will be 50 x 120 and either five or six storeys in height of modern, fireproof construction, and will cost between $50,000 and $60,000.

Leamington, Ont.—The plans for the proposed armory for Leamington have been received by Dr. Hillier, and call for a building 85 x 185 feet, to cost in the neighborhood of $26,000. to be erected in 1915, also a promise of one this year to cost $10,000. The structure will be built at the fair grounds, on the site of the present main building, and apart from drill purposes will also be used by the Agricultural Society during fair time.

Contracts Awarded

Ottawa, Ont.—The Government have awarded the contract for the ice-breaker for the Department of Marine and Fisheries, to the Canadian Vickers Co., Ltd. The vessel will be built at Montreal and will cost nearly a million dollars.

Toronto, Ont.—The Ontario Car Ferry Co., has awarded a contract to the Polsons Iron Works, Ltd., for a new car ferry to run between Cobourg, Ont., and Charlotte, N.Y. The ferry will be 318 ft. long, 54 ft. beam and 20 ft. 6 in. deep from main deck.

Dominion Power & Transmission.—A contract has been awarded by the Dominion Power & Transmission Co. to the Canadian Westinghouse Co. for the supply of motors and generators for the new steam plant. The contract price was $360,000.

Sarnia, Ont.—Bids for the new waterworks system at Point Edward were accepted last Wednesday evening as follows:—Laying of pipe, McGee & McGee, of Point Edward; the Page Hersey Co., Welland, the contract for the steel pipes; Fairbanks-Morse Co., Toronto, the contract for the hydrants; and the Mueller Co., of Sarnia, the contract for the service fittings.

Port Arthur, Ont.—The Thunder Bay Contracting Co. understands that it has been awarded the contract by the Public Works Department, Ottawa, for Port Arthur breakwater extension. The work is a 2,500-foot extension from the easterly end of the present breakwater opposite the Government elevator. No statement has been issued but the contract price is believed to be around $250,000.

Refrigeration

Thorold, Ont.—Richard Thompson, of Merritton, has the contract of erecting the ice-plant for William C. Wilson & Co.

Berlin, Ont.—McCutcheon Bros., meat dealers, are having their market equipped with a 4-ton refrigerating machine, supplied by the York Manufacturing Co., York, Pa.

Gleichen, Alta.— Fire destroyed the new plant of the Pacific Cold Storage Co., recently. The loss is estimated at $17,000, of which only $5,500 is covered by insurance.

Brantford, Ont.—It is reported that a company is being formed to build and equip an artificial ice plant, with a capacity of 40 tons of ice per day and calling for an expenditure of $75,000.

Sydney, C.B.—The Board of Trade has decided to recommend a Federal subsidy for a cold storage plant to be erected in Sydney. The erection of this plant is for the convenience of fishermen operating on the coast of Cape Breton, and for general produce storage.

London, Ont.—The Carling Brewing & Malting Co. have decided to install an entirely new equipment of atmospheric ammonia condensers in connection with their present refrigerating plant. The improvement will be made by the Huetteman & Cramer Co., Detroit, Mich.

Sudbury, Ont.—The Sudbury Brewing and Malting Co. are enlarging their refrigerating plant by the addition of new double-pipe ammonia condensers, oil traps, suction and discharge lines, etc., all of which is being furnished and installed by the Huetteman & Cramer Co., Detroit, Mich.

St. Thomas, Ont.—The St. Thomas Packing Co. are adding to their plant a complete raw water ice making system of 15 tons capacity, consisting of ice making tank with coils, cans, covers, accumulator, circulating propellers, thawing apparatus, traveling hoist, filters, cold water storage tank, and a complete air plant, as well as direct expansion piping for storage rooms. All the equipment is being furnished by the Huetteman & Cramer Co., Detroit, Mich.

Windsor, Ont.—The Central Ice & Cold Storage Co. has been organized by J. W. Klingensmith and Edwin Wallace, and will build an ice factory of 50 tons daily capacity and a cold storage house with about 12,000 square feet of floor space on two floors of a building to be 80 x 150 feet, the remainder of which will be used for general storage. The contract for machinery has been let to the Canadian Ice Machine Co., representing the York Manufacturing Co., York, Pa.

Medicine Hat, Alta.—Arthur Pierson and William Davison, of the Medicine Hat Pure Ice Co., have presented to the city officials the plans for the new ice-skating and curling rink which they are to build this year. The plans for the ice plant have not yet been finished. Until these are approved the final agreement will not be signed up. The new rink will have a seating capacity of nearly 2,000, will have toilets, cloak rooms, and a cafe or tea room in connection. The building will be 112 feet x 50 feet.

Wood-Working

Markdale, Ont.—Geo. Watson, Flesherton, Ont., will erect a sash and door factory here.

Oxford, N.S.—The Oxford Furniture Co., is making additions and adding new machinery to its factory.

Sarnia, Ont.—E. C. Lawrence, who some time ago sold his interests in the Laidlaw Lumber Co., will shortly erect a large new planing mill on his property at Devine and Christina streets.

Toronto, Ont.—Fire broke out in the Eastern Avenue and St. Lawrence Street

yard of the Laidlaw Lumber Co., March 16, causing a loss of $50,000, covered by insurance, and throwing eighty-six men out of work temporarily.

Woodstock, Ont.—Building operations have started at the Canada Furniture Manufacturing Co.'s local plant. Material is being delivered on the ground now for a four-storey factory addition, 100 x 60 feet, to the present buildings, and to be used for manufacturing purposes. The addition will entail an expenditure of about $15,000, and will represent only a portion of the money to be spent on the factory improvements this year.

General Industrial

Montreal, Que.—The American Canning Co. may build a factory here.

Niagara Falls, Ont. — The Niagara Linen Co. will build a factory here.

Montreal, Que.—The Alaska Feather Bed Co., will make an addition to their factory.

St. John, N.B.—Harmon Bros., of this city, will build a factory for making aerated waters.

Drummondville, Que.—A factory to cost $120,000, will probably be built by the O. B. Shoe Co., Ltd.

New Westminster, B.C.—The St. Mungo Canning Co., will erect a large cannery here.

Hamilton, Ont.—The Standard Underground Cable Co., will erect an addition to its factory, to cost about $150,000.

Sarnia, Ont.—The Sarnia Fence Co., have decided to build a new plant at Fort William. The estimated cost is $75,900.

Toronto, Ont.—The village of Birchcliffe have decided to organize a fire brigade. Equipment costing $600 will be purchased.

Port Colborne, Ont. — The Board of Trade are negotiating with a stock food company, which desires to establish a factory here.

Montreal, Que.—The Berliner Gram-ophone Co., will probably build an extension to their factory, St. Antoine and Leonore streets.

Montreal, Que.— The Argus Fire Alarm Co., of 54 Notre Dame street, east, may erect a factory here to manufacture their fire alarms.

Lethbridge, Alta.—A disastrous fire at Magrath, Alberta, on March 17, reduced to ashes the 300,000 bushel elevator of the Pioneer Grain Co.

Dundas, Ont. — The Board of Trade have received inquiries from three firms desiring to establish industries here. No details available at present.

Regina, Sask.—Leitch Bros. will erect a flour mill having a capacity of 3,000 barrels per day. The city will give the company a site and bonus.

Montreal, Que.—The American Flexible Belt Co., of Canada, are contemplating building a factory here. The company have a capital of $75,000.

Pabos, Que.—The Dominion Government has undertaken to build a harbor for the St. Lawrence Pulp and Lumber Corporation here.

Vancouver, B.C.—The Imperial Oil Co. will build a refinery at Port Moody. Mr. R. S. Drake, Chief Construction Engineer of the company will be in charge of operations.

Moncton, N.B.—J. A. Marven, Ltd., biscuit manufacturers will build a new factory this year. The building will be 140 x 60 feet, and four storeys high. New machinery will be required.

Stratford, Ont.—One thousand yards of gravel has been delivered for cement work at the Morelock and Diebel factories. They will be located on Norfolk street, east of Borden street.

Gravenhurst, Ont. — Flax Towels, Limited, has been organized to put up a plant here for the purpose of manufacturing towels from flax straw. Later a linseed oil mill will be constructed, as well as an additional plant to manufacture other fabrics.

Sarnia, Ont.—Fire on March 17, totally destroyed the plant and contents of the John Goodison Thresher Co. The loss, which is covered by insurance, is in the neighborhood of $250,000.

Collingwood, Ont.—The town council are negotiating with an industrial concern now located in a city in Ontario, who will probably locate here. No details are being given out for the time being.

St. John, N.B.—The New Brunswick Packing Co., Ltd., has just been organized. The company propose to establish a pork packing plant and have already purchased five farms on which to raise hogs.

Grimsby, Ont.— Councillor Walker has been instructed to purchase fire extinguishers and place them on the hose reel immediately. This is being done under instructions from the fire underwriters.

Toronto, Ont.—On March 11, fire destroyed a building on King street, west, occupied by George A. Rudd & Co., and Robert Crean & Co. The loss is estimated at $130,000, of which $95,000 is covered by insurance.

Galt, Ont.—A. Richardson, of Toronto, has been in town promoting the Lion Silverware Co., in which a number of Toronto men are interested. The present plans are to locate their manufacturing works in Galt.

Neepawa, Man.— The Jackson Sheaf Loader & Carrier Co. may purchase the building formerly occupied by the Neepawa Match Co. The company is capitalized at $30,000, and will manufacture Jackson's sheaf loader.

Kelowna, B.C.—W. Beaver-Jones, publicity commissioner, states that a company, with headquarters in Calgary, will build a canning factory here, and that work on the building will be commenced shortly.

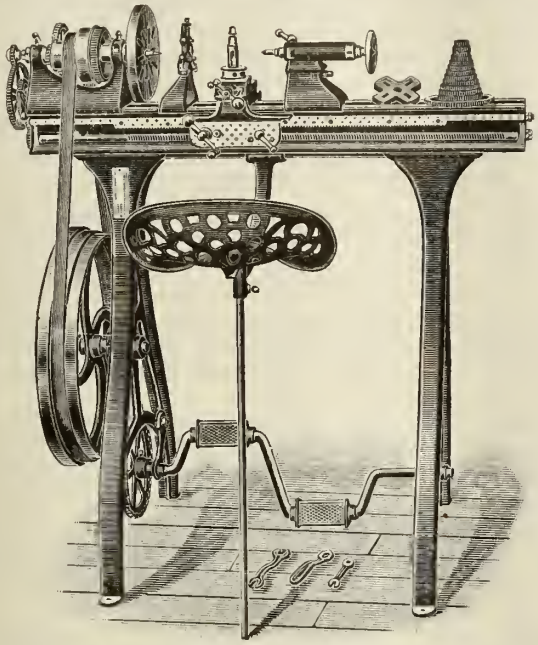
Coaticook, Que.—The Neidner Co., of Malden, Mass., will build a plant here for manufacturing fire hose. The town will give the company financial assistance and cheap power. A by-law will be voted on in the near future.

Wallaceburg, Ont. — Mr. Fligg, of Lanark, Ont., has arrived in town to take charge of the Knitting Works, which resumed operations last week. New and up-to-date machinery has been installed and the old machinery discarded.

Arnprior, Ont. — The Arnprior Felt Co., now located at Galetta, will probably build a factory here. The company propose to purchase an existing factory, and make considerable extensions. The town will offer a loan and other concessions.

Welland, Ont. — The Ontario Tire & Rubber Co., has leased the vacant Beatty plant for its factory here and has purchased the necessary machinery equipment. A co-operative tire business will be carried on and the prospects for success are bright.

Victoria, B.C. — An Austrian firm which manufactures sawdust briquettes has written to the Development League requesting to be put into touch with firms who could quote them prices for sawdust to be shipped to their manufactories in Austria.



Winnipeg ,Man.—The Watkins, Medical Co. have purchased a site here, and will build a large factory for the purpose of manufacturing medicines, grocery sundries, etc. The company have branches in several large cities in the United States.

Toronto, Ont. — A building permit has been issued to Lever Bros., manufacturers of Sunlight soap, for the erection of a two-storey brick, steel and

concrete hydrogen house at their works on Eastern avenue. The new structure will cost $36,000.

Montreal, Que.—At the annual meeting of the Asbestos Corporation of Canada, Ltd., held here on March 11, S. D. Sharpe, the manager, stated that new properties were being developed and the work put on a more economical basis. New equipment may be required later.

Galt, Ont.—The Christie Lime Co., will make alterations to their plant which will entail an expenditure of upwards of ten thousand dollars. A three-storey building, 28 x 50 feet, will be erected at their siding in which heavy machinery will be installed for the crushing and grinding of lime.

Granby, B.C. — The new 2,000-ton smelter of the Granby Consolidated at Granby Bay, B.C., which was to have commenced operations last week, has been delayed owing to a breakage in the dam. The blowing in of the smelter is expected to bring much activity in the copper mining districts.

Dunnville, Ont.—The Sewsure Manufacturing Co., makers of shirts and aprons, is moving this week to Toronto. The industry, which was started in a midest way a few years ago by Robert Jackson, and is now owned by Charles M. Armstrong, has grown to considerable proportions.

Regina, Sask.—A large programme of construction has been completed by the directors of the Saskatchewan Co-operative Elevator Co., for the coming spring. Mr. Dunning states that the directors have practically decided to erect at least 25 elevators, and, if possible, to purchase already existing elevators.

Owen Sound, Ont.—The McQuay Tanning Co., has withdrawn its application to the town for a loan of $25,000, and will go ahead and make the proposed extensions to its plant without municipal aid. They purpose doubling the capacity of their plant, which is devoted exclusively to the manufacture of high grade harness leather.

Vancouver, B.C.— Secretary Wesley A. Blair of the Board of Trade, was notified on March 13, that two directors of the Eureka Fireless Stove Co., of New York and Los Angeles were on their way to Vancouver to look over the ground and trade conditions with a view to establishing in Vancouver a factory that will employ 500 men.

St. Catharines, Ont.—A contract has been awarded by the Lord & Burnham Co., of New York, to the Samuel Austin & Son Co., of Cleveland, O., and Thorold, Ont., for the erection of their new factory building on Vine street, St. Catharines. The contract for steel work has been awarded to the Standard Steel Construction Co., of Welland.

Preston, Ont. — Kinzie & Son, manufacturers of pressed bricks, tiles, etc., have purchased sixteen acres of land from Jesse A. Witmer at Speedville, suitable for their line of business. They have moved their machinery to the new site and are preparing to meet the spring trade. They will install hydro power to operate their machinery.

New Glasgow, N.S.—The plant of the Standard Clay Products was destroyed by fire on March 12, the loss representing about $60,000. Workmen aided the firemen in fighting the fire, which started in the main building and spread rapidly. The buildings covered a large area and the blaze lit up the whole countryside. Seven years ago the plant was wiped out by a fire.

Raymond, Alta.—In order to work up an interest in sugar beet raising, the Knight Sugar Co., will offer about five hundred dollars in prizes this year. It is proposed to place it in the hands of the agricultural society, and thus get the advantage of the additional Government grant, which will amount to $1,000. This amount will probably be divided into about 100 prizes.

Fort William, Ont. — The Algoma Steam Laundry Co., Ltd., of this city, plan to double the capacity of their present plant. Tentative plans have been prepared and will be submitted at a meeting of the company to be held very shortly for ratification. If the plans meet with approval, the extensions will call for an expenditure of about $15,000, and the completion of the building by the first of June.

Chatham, Ont.—The industrial committee of the city council has several propositions on hand to bring new concerns to Chatham to locate here. Negotiations are being carried on with one outside company who are desirous of locating in the old Defiance Ironworks plant, on Lacroix street. If the proposition goes through, the city will sell the plant for $21,000, of which $1,500 will be paid down and similar payments will be made each six months.

Medicine Hat, Alta.—An industry is being established by Beggs Brothers who have recently come from Toronto, and are installing a thoroughly modern dry cleaning plant. A two-storey fireproof building has been built on Main Street near the Medicine Hat Steam Laundry and all the equipment, including "Bowser" gasoline washers, distilling apparatus, extractors and steam boards are being set up in readiness to begin work in a few days.

Brantford, Ont.—Lloyd D. Barber, architect, has returned from a visit to the mills of Tonawanda, N.Y., the object of his trip being to gain information for the Niagara Silk Mills Co., at Buffalo and Dunkirk for preparation of the plans for the mill which this company intends erecting here. It is expected that work will be started on a 165 by 52 feet three-storey factory about April 1. The company is doing a large business in the United States, and the Canadian end of it is likely to assume considerable proportions.

Cobourg, Ont.—At a special meeting of the town council, a resolution was passed approving of submitting a by-law to the electors to grant a bonus of $10,000 to a felt factory which is to locate here, operated by Messrs. Charles and John Dick. The site chosen is that of the woollen mills, formerly operated by John Dick, Ltd. The company agrees to employ fifty hands the first year on an average, and one hundred the second, third and fourth years, and two hundred hands for the five following years. They are also to have a paid-up capital of $90,000.

Brampton, Ont.—The Williams Shoe Co., Brampton, which has been carrying on business here for a number of years, closed down six weeks ago. The buildings and business have been taken over by a new company, the heaviest stockholders being John McMurchy of Brampton and S. Mullett of Orillia. The rest of the stock is being taken up by local people. The price paid for the business was $57,500. The factory will continue operations under the name of the Williams Shoe Co., and will open up again next week. One hundred and fifty hands were employed and a business of half a million dollars was transacted last year.

Sandwich, Ont. — The plans of the Canadian Alkali Co.'s $500,000 factory, which will be built in Sandwich this year, have been placed before the town council, and the usual exemptions given to new industries have been granted. The company intends to employ between 300 and 400 men at the start, and the pay roll will amount to $150,000 annually. The manufacture of caustic soda, chloride of lime, salts and other chemicals will be carried on. It is expected that the commencement of building operations will induce local capitalists to invest in workmen's dwellings, which are badly needed.

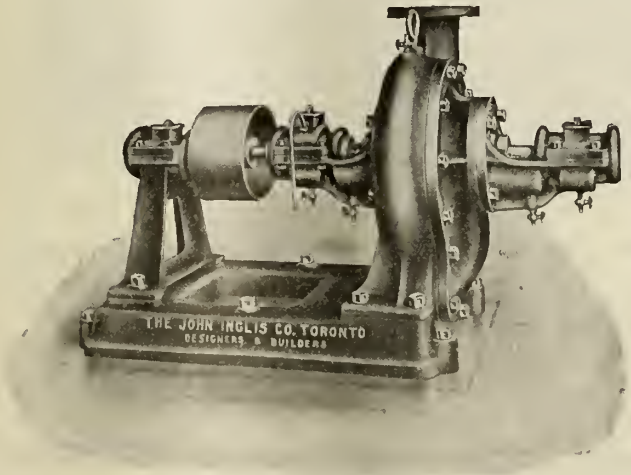
Sherbrooke, Que.—The Brompton Pulp and Paper Co. will erect a new paper mill at East Angus for the purpose of manufacturing news-paper. The contract was awarded for the machinery to the J. H. Horne & Sons Co., of Lawrence, Mass.,

Insured, against what?

Maybe you have your plant fully covered as regards loss by fire.
Maybe you think that a sprinkler system couldn't give you any further protection.
But, if your plant is burned down, have you figured what you stand to lose through—

Inability to fill existing orders?
Unemployment and consequent disintegration of a valuable work-force?
Inability to go after new orders, because you can't fill them on time?

These are the sort of things that insurance does not cover. They are the irretrievable losses in any industrial fire.
And against such as these is the kind of protection given you by



Manufacturers' Automatic Sprinklers

They save their cost in five years in the cut they make in your insurance rate.
They're always on the job, ready to throttle the small blaze before it has time to develop into a disastrous fire.
They are a real protection—the sort that make you sleep easy at night.
Write to us for details that will interest you.

at a meeting of the directors held in the city. The new building, which will be located on the west side of the river St. Francis, is to be 72 feet by 444 in length, two storeys high, of concrete, brick and steel with a concrete roof. The power house adjoining will be 52 feet by 108 feet, and power to the extent of 1,000 horse power will be developed. The work on the building will begin at once, and it is expected that the Company will begin to turn out paper from the new mill about the first of October.

Arnprior, Ont.—At a meeting of the Arnprior Board of Trade last week a committee comprising Messrs. S. R. Rudd, Thos. Moran, E. D. Osborne and J. C. Williams was appointed to look into the proposition of the Arnprior Felt Co., whose plant is now at Galetta. We learn that in return for a loan of $10,000 for ten years, payable in annual instalments without interest and exemption from all but school taxes for the same time, they promise to purchase the shirt factory property and rebuild a three-storey brick factory; install machinery to the value of from $10,000 to $15,000; pay wages to the amount of $10,000 the first year and at least $15,000 during each of the nine subsequent years; employ 30 hands first year and from 40 to 50 afterwards, the town to be guaranteed by mortgage and insurance on building and plant.

Railways—Bridges

Berlin, Ont.—An important change is soon to be made on the Galt and Elmira branches of the Grand Trunk Railway out of Berlin, by which gas-electric radial cars will supplant the steam lines.

Lethbridge, Alta.—"We have ordered the steel, and will call tenders for the construction of the 13th street subway in a very few days," said D. C. Coleman, superintendent of the Alberta Division of the C.P.R., when he passed through the city on March 7.

Islington, Ont.—A new bridge is to be erected over a tributary of the Humber at Thistletown. Engineer Barber was instructed to prepare plans for the structure. It will be of concrete and steel construction, and will cost $3,900. Tenders for the construction will be called at next meeting.

Montreal, Que.—A budget calling for an expenditure of about $2,000,000 during the present year, on improvements of the service is being prepared by the Montreal Tramways Co., and will provide for the laying of new tracks, erection of two new car barns, and the purchase of one hundred new double truck cars.

Guelph, Ont.—Ald. Hannigan will call a meeting of the railways and manufactures committee of the city council to consider the building of a hydro-electric railway to Hillsburg, Erin and Orangeville. Between this territory and Guelph there was formerly close connection, but the Credit Valley branch of the C.P.R. diverted traffic to Toronto.

Montreal, Que.—At a meeting of the directors of Toronto Terminal Co., William Wainwright, of the Grand Trunk, was elected president, and David McNicoll, of the C.P.R., vice-president. Henry Phillips, secretary of the Grand Trunk Pacific, was appointed secretary, J. G. Suckling of the C.P.R., Toronto, treasurer, and Mr. Ardley, of the G. T. R., auditor.

Galt, Ont. — George Mountain, chief engineer of the Dominion Railway Board, after inspecting the L. E. & N. crossing on the East River road below Galt, which the North Dumfries Council protested as being dangerous, ordered that an electric signal bell be placed at the crossing, the road south of the crossing be widened, and that the Grand Valley Railway raise its tracks to the level of the approach to the L. E. & N. crossing.

Vancouver, B.C.—The Burrard Inlet Tunnel & Bridge Co., have decided to call tenders for the construction of the Second Narrows Bridge. The undertaking will cost about $2,540,000, and it is estimated that it will take about two years to complete. As an encouragement to finish the work quickly, $200 bonus per day is offered for every day the work is finished under the time limit, and a penalty of $200 a day for every day past the time limit will be levied.

St. Thomas, Ont.—St. Thomas, Aylmer, Yarmouth and Malahide having decided to secure independent estimates of the cost of building a radial line east of St. Thomas before going on with the proposal to guarantee $300,000 bonds of the London & Lake Erie Railway & Transportation Co., directors of the latter announce that they have withdrawn the proposal for the present, but will consider a new proposal when the municipalities are ready.

Vancouver, B.C.—Twenty million dollars, exclusive of terminal expenditures in this city, is approximately the amount of money the Canadian Pacific Railway will spend in the West this year, according to Mr. J. G. Sullivan, chief engineer. Most of the money appropriated to carry out this year's improvement programme will be expended in British Columbia, finishing the double-tracking operations. In addition, the company has about six hundred miles of new line to construct on the prairies. While there will be a large expenditure on construction, the heavy cost will be for rails and new ties.

Personal

W. Millar has been appointed Canadian manager of George Anderson Co., of Montreal, makers of stone-cutting machinery.

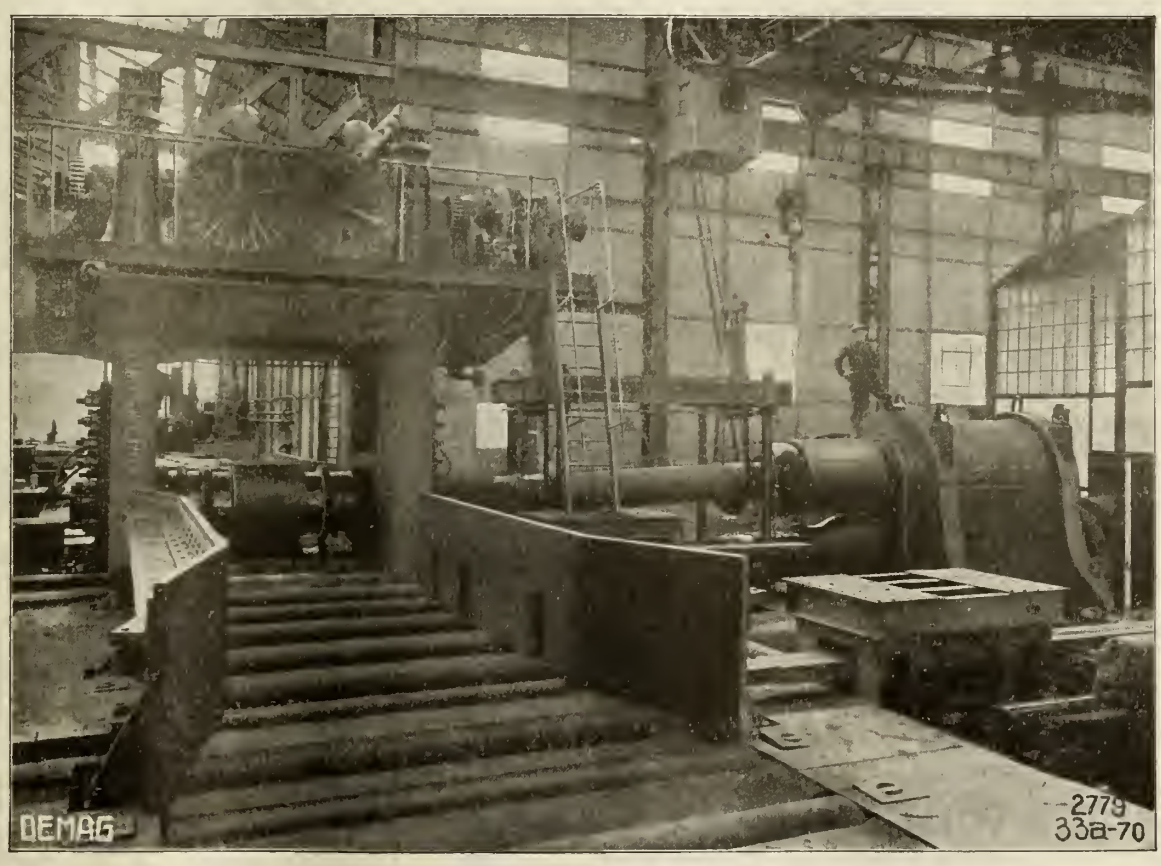
Vincent Simpson, of Gerald Lomer Ltd., Montreal, is now in the West on a business trip. He will visit the principal cities.

David Keay McLaren died at his residence 419 Mount Pleasant avenue, Montreal, on March 18, aged 78. Mr. McLaren was the head of D. K. McLaren, Ltd., belting manufacturers.

Edmund B. Temple, C. E., who retired a year ago from his position as harbormaster at Port Arthur, died at his residence in Toronto, in his 77th year. He was formerly a government engineer in the latter city. He was born in Quebec.

James Cornelius Sullivan, harbormaster of the city of Quebec, and well known to shipping and railway men all over eastern Canada and the transatlantic route, died on March 23. He had been harbor-master sixteen years, and succeeded his father in the position.

Charles T. Lamb, for many years assistant treasurer and office manager of F. E. Reed Co., Worcester, Mass., manufacturer of the well-known "Reed" lathes, and for the past two years office manager for Reed-Prentice Company, will resign on May 1st, 1914. Mr. Lamb will engage in other business.



William Apps, who, twelve years ago was master car builder for the Canadian Pacific Railway in Montreal, died from heart failure at his late residence, 98 Forest Hill Road, on Saturday last, in his sixty-seventh year. He had been living retired in Toronto for the past twelve years, and had been ill for three months.

A Notable Meet Under Mount Royal

The marvellous engineering knowledge that enables the workers on the great tunnel under the mountain at Montreal to meet at the centre only three-fourths of an inch out, is graphically told by the chief engineer, Mr. Brown, in the April issue of MacLean's Magazine.

Blasting out the bluish-grey rock, fighting the gases that often defy analysis, locating pockets of water and exploring old volcanic foundations —all these make the work of tunnelling a most romantic undertaking.

Photographs of the interior meet, of the engineer at work, and of the other interesting features add to the enlightening and informing entertainment in this, the best issue of the year of Canada's leading magazine.

Furthermore, the second of the Coburn covers—something entirely new and appealing to one's artistic sense, appears on the April cover.

These features alone are worth the low annual subscription price, but its readers will enjoy, besides these, some surprises in the following:

1. Romance of the Taschereau Family.
2. How the R. M. C. Develops.
3. Margaret Anglin—Our Actress.
4. Some Rich Indians in Canada.
5. The Business Outlook,

and several short stories of unusual merit that afford a brief relaxation from the world of realities, carrying one into the by-ways of exciting romance and adventure.

DON'T MISS THIS NUMBER.

Send a postcard instructing us to add your name to our subscription list.

Write Dept. M. Subscription $2.00 a year. Twenty Cents a copy.

W. E. Burke has been appointed assistant to J. W. Norcross, managing director of the Canada Steamship Lines.

Walter E. Gunn, who has been for the past two years publicity commissioner of Prince Albert, Sask., has accepted the position of industrial commissioner of Vanderhoof, B.C., on the main line of the G.T.P.

The Babcock & Wilcox Co. have been awarded a contract by the Brompton Pulp and Paper Co., Ltd., Sherbrooke, Que., for four 300 h.p. boilers, complete with superheaters and chain-grates. They have also received an order for three 219 h.p. boilers, steel cased, from the University of Alberta, Edmonton.

L. C. Fritch, chief engineer of the Chicago Great Western Railroad, has been appointed assistant to the president of the Canadian Northern Railway. Mr. Fritch will assume his new duties on April 1, with headquarters in Toronto. His duties will be to assist the president in all matters pertaining to the operation of the road, and will not be confined to any particular department.

D. K. McLAREN DEAD.

DAVID KEAY McLAREN, president of D. K. McLaren, Ltd., Montreal, the well-known makers of high grade leather belting, died at Montreal on March 18th, after a long illness. The deceased was born in Perth, Scotland, on February 20, 1835, and was thus in his eightieth year.

Mr. McLaren had an active career and was one of Montreal's pioneer business men. He came to Canada in May, 1852, and went later to Southern Vermont, where he engaged in the boot and shoe business. In 1864, however, he returned to Montreal where he continued to reside up to the time of his death. For a great many years he was associated with other members of his family in the leather belting trade, and finally in the year 1896 set up in business for himself. In 1907 his business was incorporated as D. K. McLaren, Ltd., with the deceased gentleman as president, which position he held up to the day of his death. He had not taken an active part in the business, however, of late years owing to failing health. The firm's interests have been and still are being looked after by his two sons, W. Fred McLaren and R. M. Walker McLaren.

The late Mr. McLaren was an active member and supporter of the First Baptist Church and the Y.M.C.A. in Montreal. He is survived by a widow, two daughters, the two sons mentioned above, and by one brother, W. C. McLaren, of Guelph, Ont.

Tenders

Fort William, Ont.—Tenders will be received by the Mount McKay Products Co., Ltd., up to Saturday, March 28th, for the erection of a crusher plant at the base of Mount McKay. Plans and specifications may be seen at the office of Antwerp & Co., Murray Block.

Outremont, Que.—Tenders are invited for the supply and delivery at the corporation yard, Outremont, of 450 street lighting standards, with globes, reflectors, insulators and sockets and accessories complete. Price to be given per standard, including delivery. Specifications and drawings can be obtained from the town engineer's office, town hall, Outremont. Tenders must be received at the town hall, Outremont, on or before Wednesday, 1st April, 1914.

Windsor, Ont.—Separate tenders, addressed to Euclide Jacques, Esq., chairman, Water Commissioners, Windsor, Ontario, and marked "Tender," will be received up to twelve o'clock noon, on Tuesday, March 31st, 1914, for: (a) 450 tons (more or less) of cast iron water pipe, size from 6 in. to 10 in.; 100 tees and 20 crosses, all according to standard specifications adopted by Canadian Society of Civil Engineers.

(b) 8-8-in. valves, 35-6-in. valves, 50 extension valve boxes, 5 ft. in length.

(c) 75 fire hydrants to bury 5 ft., having 6-in. barrel with two 2½-in. and one 4-in. steamer connection.

(d) 10 tons pig lead—all to be delivered f.o.b. cars Windsor.

Regina, Sask.—Sealed tenders, addressed to the City Commissioners at Regina, Sask., will be received up until noon of March 28th, 1914, for the supply of generating equipment, consisting of:

(1)—Station switchboard, consisting of two exciter panels, six generator panels, one totaling panel and sixteen feeder panels.

(2)—Six three-phase feeder regulators.

(3)—One motor-driven exciter, 125 k.w.

(4)—One geared turbine-driven exciter, 125 k.w., electrical end speed not over 900 r.p.m.

Distributing equipment, consisting of:

(1)—Weather-proof copper wire.

(2)—Insulators, top pins, etc.

(3)—Cross-arms.

(4)—Pole line hardware.

(5)—Cedar poles.

(6)—Pole type transformers.

(7)—Street lighting equipment.

(8)—Cut-out mast arms.

(9)—Integrating watt meters.

Specifications may be obtained from E. W. Bull, superintendent of light and power, Regina, Sask.

Catalogues

"Corona" Drilling Machines, made by Fredk. Pollard & Co., Ltd., Leicester, England, are described fully in a catalogue which we have received from the Dominion Machinery Co., Toronto. These drills are of the high-speed type, and are fitted with Hoffman ball bearings. Each twpe is illustrated, and accompanied by a specification and prices.

The Dominion Machinery Co., Toronto are distributing leaflet No. 44, dealing with two and three-phase induction motors manufactured by Wright & Wood, Ltd., Halifax, England. These motors are specially designed for hydro-electric service of 25 and 60-cycle circuits. The bulletin contains a general specification, and several illustrations with 3-phase starter connection diagrams on the last page.

Brass Foundry Equipment is the subject of Bulletin No. 31 issued by J. W. Paxson Co., Philadelphia. Pa. A complete line of brass foundry equipment is covered in this bulletin, with the principal sizes and prices for each product. The heavier equipment includes furnaces, crushers, magnetic separators, moulding machines, and sprue cutters, etc. The bulletin is fully illustrated, and contains 55 pages.

Oilstone Grinders. — The Mummert-Dixon Company, Hanover, Pa., are distributing Catalogue No. 5, descriptive of their line of oilstone grinders, of which there are several types. Illustrations are given of each type, together with a specification covering the principal dimensions and features. A general description and erecting plans are also included, while the catalogue concludes with a partial list of users.

An Electric Portable Buffer is the subject of Bulletin No. 20 issued by the Stow Manufacturing Co., Binghampton, N.Y. Particulars are given of the four sizes in which this machine is built, and illustrations show it in operation under various conditions. One of the principal uses to which this buffer can be put is polishing bright metal parts of automobiles. H. E. Barton Tool and Supply Co., Chicago, are sales agents.

Potter & Johnston Machine Co., Pawtucket, R.I., have sent us Catalouge No. 24 describing their 2P combination automatic piston and piston ring machine. The principal dimensions are given of this machine, and the illustrations include plans showing the work in the machine and method of operation. An erection plan is included showing the principal dimensions for erecting purposes. Copies may be obtained from the Canadian office, room 1410, C.P.R. Building, Toronto, Ont.

Improved Machinery

ls constantly being lnstalled ln every works to help keep labor costs down to the minimum, to get the utmost for every dollar expended.

We live ln an age of efficiency, and you too, probably, have all your machines carefully selected with a view to maxlmum output.

But do you realize that lt is in the hand-work—the fitting, that the greatest amount of money is usually wasted—and that it's up to you to select the hand-tools your men will work with, just as carefully as you select the most complicated automatic machine?

So look into the merits of long-lasting, clean-cutting, crucible steel

Delta Files

for tbeir efficiency as hand-finishing tools ensures your fitting costs being kept at a minimum.

Deltas cut clean and last long, give a smootb finlsh, yet remove a big amount of metal.

Give tbem to your most skilled employee as well as to your apprentices—they will enable each to do work, the best he knows how.

You will find them at your jobbers, or if not write us direct—but always look for this trade-mark on tbe tang.

TRADE MARK DELTA

It safeguards you and all file users everywhere.

In the United States, Simonds Mfg. Co.

The Garvin Machine Co., New York, have issued their catalogue for 1914, which is of the same high-class standard as previous editions. The principal machine tools described are milling machines of various types, drills, screw and tapping machines. Other tools are dealt with, and also many different attachments for various purposes. There are numerous illustrations and several useful mechanical tables. The catalogue is pocket size, of 322 pages, including a complete index and telegraph code.

The Metallurgic Engineering Co., Chicago, Ill., have sent us a copy of their "Electric Furnace Bulletin," which deals with electric furnaces built on the Snyder system. A comprehensive description is given of this furnace, and also of the method of operation, while an interesting table is included showing the cost of melting steel. The sizes of furnace covered by this bulletin range from 2½ to 60 tons per day, but we understand that furnaces are built by this company which will take care of 180 tons of steel per twenty-four hours. The bulletin is fully illustrated.

Book Reviews

The Department of Labor, Ottawa, has published part 4 of the report submitted by the Royal Commission on Industrial Training and Technical Education. The report is exhaustive and contains information, bearing on the above subject, obtained by the commission from many authorities in all parts of Canada. Every phase of technical education is covered by the report which also contains much data regarding various industries. The report embraces 714 pages of very interesting and instructive matter, which will be valuable to those interested in the subject. The commission have evidently done their work thoroughly, as the exhaustive nature of the material collected indicates.

The Bureau of Mines, Department of the Interior, Washington, D.C., have published bulletin 58, entitled "Fuel-Briqueting Investigations." The bulletin contains a description of various plants for making briquets and results of tests made on the product, using different kinds of coal. The data collected covers a number of years, some of it having already been published in bulletins which are now out of print. The main features only have been reprinted in addition to the new material. The results obtained from tests are arranged in the form of tables which contain some valuable data on briquets and their value as fuel. The illustrations include diagrams of plants, views of machines, and briquets undergoing a weathering test.

Our first aim is to please our customers.

Why not give us a trial, when next in the market for Pumping Machinery?

Spot and Butt Welding MACHINES

Do the Work Rapidly and Economically

We are the pioneer builders of Electric Welders in Canada. If you do any quantity of welding or riveting you should investigate, at once, the merit of AGNEW Electric Welders. Let us study your welding problems and advance our ideas regarding your particular work.

Our machines are of the highest electrical efficiency and we find by actual meter tests that they will in all cases do a given amount of work with less consumption of current than any other machine on the market.

We have good facilities for demonstrating these claims and the intending purchaser of electric-welding apparatus who expects to use a considerable amount of electric current should investigate this feature.

No. 21-D Spot Welder

will spot-weld from No. 30 to No. 10 sheet metal.

Depth of throat, 14 inches.

Adjustment of lower horn, 7 inches.

Water-cooled reversible points.

Height of dies from floor, 40 inches.

Floor space, 18 x 32 inches.

Transformer capacity, 15 K.W.

Operated either by foot-lever or belt power, leaving the operator free to use both hands.

Speed 100 to 160 welds per minute.

No. 10-C Butt Welder

Capacity ⅛" to ⅝" round, ⅛ x 2 inches flat, stroke of movable carriage, 3 inches.

Adjustment of clamps, 1¼ inches.

Vertical adjustment of fixed carriage, ¾ inch above and below movable carriage.

Tilting adjustment of 10 degrees.

Transformer capacity, 10 K.W.

Height, floor to dies, 32 inches.

Will weld any length Butt or Tee.

Ask for catalogue. We are in position to build machines for any special work.

This is our New Improved Wet Tool Grinder—an ideal machine for your grinding needs. It is of extra heavy construction throughout, and all bearings are of large proportion and self-oiling.

The packingless vertical centrifugal pump furnishes a liberal though easily regulated supply of water to the face of the wheel; the large water-pan prevents water splashing on the floor.

This is one of the best wet-grinders made. Built in 14, 20 and 30-inch size. **Get our catalog, which describes it in detail.**

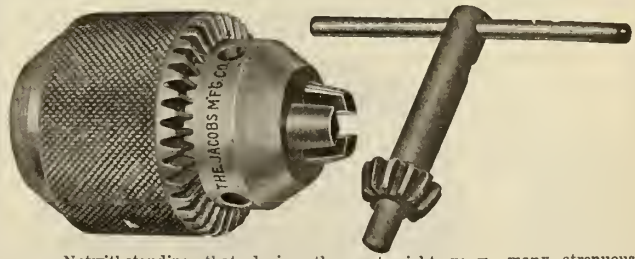
"CUSHMAN" CHUCKS

are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.



Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.

Catalog Free

THE CUSHMAN CHUCK CO.

Hartford, Established 1862 Conn., U.S.A.

Our Last Year Our Best Year

Notwithstanding that during the past eight years, many strenuous attempts have been made to displace the Jacobs Improved Drill Chucks, by offering to our customers numerous Drill Chucks, alleged "just as good as the Jacobs," OUR LAST YEAR WAS OUR BEST YEAR. This fact is the best possible proof of the real merit of the Jacobs Improved Drill Chuck, and of our equitable dealing.

CASLER OFFSET BORING HEAD

saves time, elliminates guess-work, and gives better results than the old-style methods. Send for the book of 12 reasons why it's a good tool, and get the full story. It's worth reading.

MARVIN & CASLER CO., CANASTOTA, N. Y.

Let This

"Mechanic's Drill"

solve your drilling problems for you.

It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

BUTTERFIELD & CO.

ROCK ISLAND, QUE. **DERBY LINE, VT.**

Three Points on Which the Accuracy of a Gear Cutting Machine Depend

Accurate Index Wheel. Inaccuracies in the index wheel show at once in gears cut by it as thick or thin teeth. B. & S. index wheels are cut with special machinery having master wheels which are as exact as skilled methods can produce.

Correct Mounting of Index Wheel. Unless the wheel is mounted on its spindle in exactly the same relation as it bore to the arbor on which it was cut it will show an error. Great care is taken in finishing the bearings of the index wheel and spindle, also in mounting the wheel to avoid error at this point.

Accurate Indexing Mechanism. Inaccuracy in the index rotating mechanism will cause an incorrectly cut gear, even if the index wheel is accurate. To detect such errors, a special testing mechanism is applied to B. & S. Gear Cutting Machines as a final test.

Rapid production is coupled with accuracy in the No. 6 Automatic Gear Cutting Machine. Capacity—Spur gears to 72" diameter, 1¾ diametral pitch in cast iron, 2 diametral pitch in steel

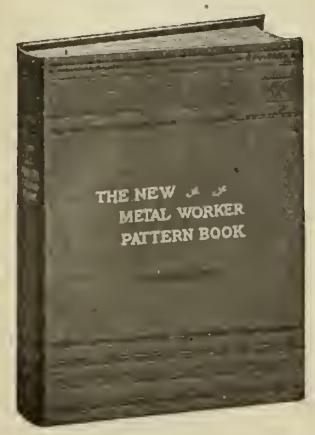
Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.



Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

The New Metal Worker Pattern Book

This is the most elaborate and complete work that has ever been brought out for the use of sheet metal pattern cutters. It is printed from new type with a new and improved arrangement, especially convenient for reference and study. Parts of a former edition, entitled The Metal Worker Pattern Book, which have been utilized in its preparation, have been re-written and simplified and later methods embodied. 218 problems are now given, 75 of which are entirely new. A Treatise on Pattern Cutting as applied to all Branches of Sheet Metal Work. By George W. Kittredge. 430 Pages; 744 illustrations; Size, 10 x 13 inches. Cloth bound, Price, $5.00. Sent postpaid only on receipt of price.

"MORSE"

Every one of our lines has successfully stood the most exacting tests. They are the product of a factory which has every facility for making reliable tools and they are recognized everywhere as such.

We have never varied our policy as to quality, therefore, tools bearing our trade-mark ("Morse") are warranted to give satisfaction.

They include Twist Drills, Reamers, Milling Cutters, Taps, Dies, Cutters, Counterbores, Countersinks, Etc.

Carbon and High-Speed Steel.

Rivett Bench Lathes

No. 5 Lathe with No. 5 Tool Post

Specifications:—Bed .....38″
Swing ..... 8″
Chuck Capacity .....⅞″

A heavy, rigid machine suitable for large work requiring accuracy.

The large Spindle Capacity is supported by more solid construction throughout.

This Lathe is especially appreciated by Manufacturers. It may be fitted up for Threading, Grinding, Milling and also as a very strong, handy and economical Screw Machine.

Write us about your requirements.

THE DICTAPHONE Girl
(REGISTERED)

"Easy! Why, I just listen to Mr. Smith's voice and write out what he says on the typewriter. I can regulate the Dictaphone to my typewriting speed, and then if I *do* happen to miss a word, there is a back spacer just like on my typewriter, and when I press it Mr. Smith's voice obligingly says the last few words over again.

"I don't have to risk my life any more by asking him to repeat—you know how Mr. Smith hates to be interrupted. It always makes him forget what he was going to say, and then he goes right up in the air.

"Yesterday I wrote 80 letters and if I had had to take them down in shorthand first, I'd have had to stick around here until all hours. As it was I got them all done in plenty of time.

"Eye strain! I'm through with *that!* And 'cold notes' don't worry *me* now. What's more, my letters are *right*. And why shouldn't they be? I copy his own words, instead of copying my notes of his words.

"I hope I never see a shorthand note-book again! I'd just as soon give up my typewriter and go back to writing letters in long-hand.

"Yes and I didn't like the idea of the Dictaphone when I started, either."

Demonstration in your own office on your own work.

THE DICTAPHONE

(Columbia Graphophone Company, Sole Distributers)
52 Adelaide St. W., Toronto

Stores in the principal cities. Dealers everywhere.

Inventors Can Use Our Machine Shop and Tools

AS many inventors are desirous and capable of making their own working models, yet have not the proper machine shop equipment and facilities, we have decided to devote sections of our modern shops to this purpose.

Our buildings will be partitioned off with the necessary machines and tools, and inventors are assured of absolute privacy.

We are the only Manufacturing Patent Attorneys in Canada, and can give you every desired assistance in your work.

Write us about ANYTHING pertaining to inventions and patents.

You Can Double Your Output

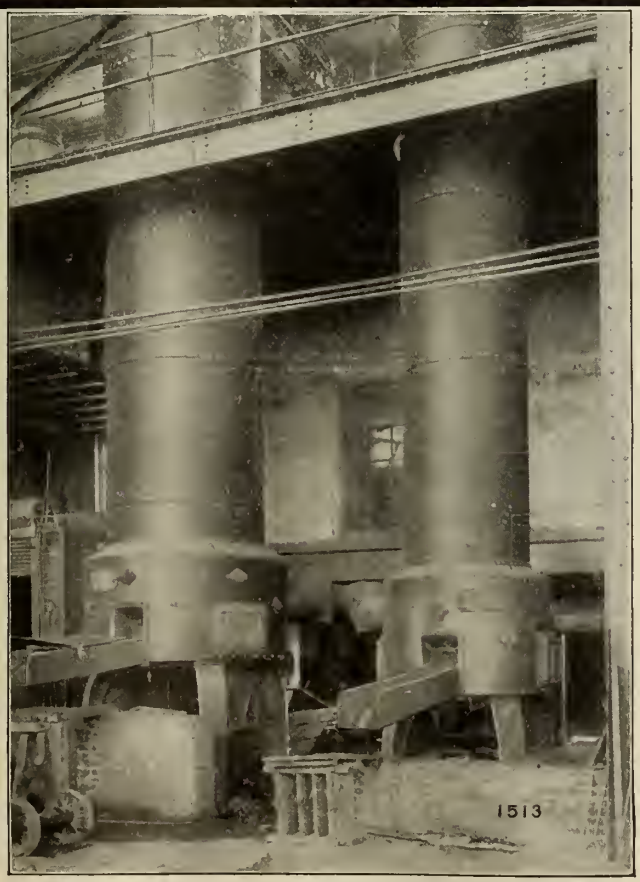
of enameled or japanned work if you cut in half the time necessary for baking. You can do this with the type of oven which can be filled to the top—which heats the product evenly all over—which provides adequate circulation. You can do it by using

CRAWFORD

Sectional Ovens

Due to the patented arrangement of the oven and its **ENCLOSED FLAME GAS BURNER**, this oven will give you equally good results, whether filled to the roof with material, or only partially filled. The positive forced circulation gives the complete heat treatment—uniformly—in every part of the oven. As the gases, fumes and moisture are forced out, the operation is very much faster than with other ovens.

If you are having the slightest trouble with your oven equipment, let us confer with you on the subject.



Send for our pamphlets—"Correct Core and Mold Drying" and "Drying Out Armature Coils."

DO IT NOW

The Oven Equipment and Manufacturing Co.

54-49 New Haven, Connecticut

One No. 5 and one No. 3 ½ Whiting Cupola in combined grey iron and steel foundry, The Delaware & Hudson Co., Watervliet, N. Y.

Take no risk on your foundry equipment. Safety and economy demand first consideration.

Whiting Foundry Equipment

is both safe and economical. Many large, successful foundries throughout the country prove this. Practical designs and heavy construction combined make it ideal for all classes of work.

Grey Iron, Brass, Car Wheel, Pipe, Steel, (O.H. and Converter) and Malleable

INCREASE YOUR

SHOP EFFICIENCY

Sectional Steel Bins and Shelving furnish a compact respository for stock, tools, etc. Economical too, last a life-time and protect against fire. Promoting order and system, they save time and breakage.

Our bins are constructed so each shelf is independently adjustable to different heights. The sections can easily be changed from shelves to bins and vice versa. Vertical partitions, bin boards, extensions for lower bins are independent, allowing of arrangement to suit any requirement. We would be glad to send you literature regarding them.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... $1.00

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.10

TECHNICAL BOOK DEPARTMENT

MACLEAN PUBLISHING CO.

143-149 University Ave., - - TORONTO

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

SERVICE ONLY— and EVERYWHERE!

From the laboratories of the gold and silversmiths to the furnaces of our iron and steel founders—that is the wide range of service covered by

Dixon Crucibles

and in either place no other crucible has ever given such reliable and satisfactory results. It's the standard everywhere. Booklet No. 27-A on request. Made in Jersey City, N.J., by the

Joseph Dixon Crucible Company

The Foundry Problem

Foundry conditions have undergone a radical change in the last decade.

The Foundry business has evolved from a "hit and miss" business into a machine business.

In modern foundries, moulds are rammed, patterns are drawn, etc., by machinery, but cored castings are still the difficult problems and the answer, unlike the arithmetical problems of youth, is not in the back of the book.

It may be in the beginning if you will use "Stevens Core Gum."

It is a dry grey powder in no way related to Pitch Compounds.

It is a real binder; the Cores have a keen, sharp edge; they will stand when green a day, a week, or a month before baking; they produce no gas, no smoke, never "blow" and are easily released from the casting.

Stevens Core Gum possesses all the merit, not found in Core Compounds, and omits the exasperating features. A keg for trial costs nothing.

Shall I send it?

FREDERIC B. STEVENS

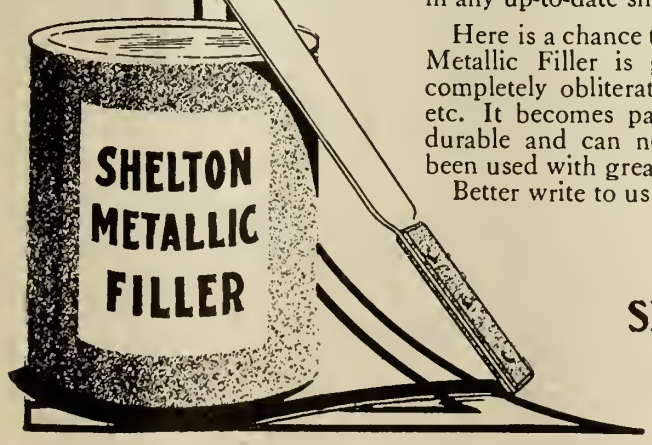
A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN



Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.

Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER

At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

Starrett Tools

are used by the men who strive for greater efficiency

The use of a Starrett Surface Gage and Combination Square by the man at the planer below is a good example of efficiency in measuring.

Accuracy is insured because they are Starrett tools, while speed and wide range of usefulness are obtained because all Starrett Tools are designed to give just that service.

The Surface Gage may be set at the proper height by sliding the blade of the square to the desired position and bringing the scriber into contact with the top of the blade.

You men with up-to-date ideas on shop management, know how much can be saved by watching the little motions and operations. You realize that a few seconds saved by each man on a single operation makes a large total.

Let Starrett tools help save those seconds.

Send for our big, new, free catalog 203, describing the full line of Starrett Tools and Hack Saws.

Garvin Screw Machines

GIVE UNSURPASSED SATISFACTION

The best materials are used in manufacturing these machines. Parts made of Krupp Chrome Nickel Steel, Drop Steel Forgings and Vanadium Steel Springs. Absolutely no steel castings used. Machines can be realigned under all conditions of wear. Spindles are of large diameter, bearings are ground and run in bronze boxes. Cross-slides fitted with plug stops, capable of fine adjustment, and can be lifted from bed without removing turret base. Hexagon Turrets on all machines, except the No. 1. Independent stops to each of the six turret holes. Our turrets and slides have long been renowned for their rigidity without cumbersomeness, the result being large output. The turret momentum is stopped by a solid plug, the lock bolt being used for indexing only. Many other exclusive features.

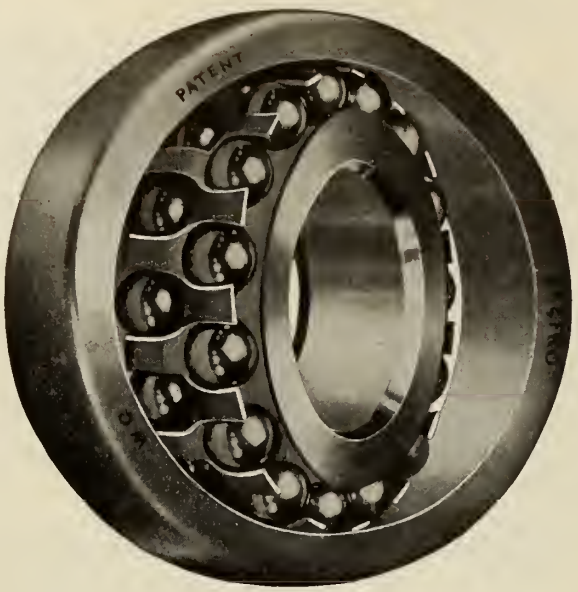
Take Time to Read Your Paper

¶ Occasionally we meet a man who says "Oh, I haven't time to read trade papers! I'm too busy."

¶ He is typical of his class, and his class is growing smaller every year. He belongs to the betwixt and between variety, neither very large nor very small. His business is large enough to keep him at detail yet not big enough to permit of his hiring help to relieve him of petty duties.

¶ We refer to the owner or manager of a business which is just at the stage when it needs all the help and brains that can be given it. If the ideas that are constantly being supplied in "Canadian Machinery" were applied to the small but growing business, as well as to the large and well-organized industry, results would be amazing.



¶ Reading a trade paper, if a good one, should be one of a business man's first duties. Let him discharge that and the other claims upon his time will grow fewer in number and greater in importance.

¶ One of the most successful of the young men we know looks through "Canadian Machinery" from cover to cover every week. He glances through the editorial section, selects any article that may be applicable to his business, reads the Industrial and Construction News, Markets and special features. Then he starts at the front and reads the advertisements.

¶ His business is well organized, and everything moves like clockwork. He always has time to listen to a good proposition and he is a consistent and liberal advertiser himself.

¶ Take a half-hitch in your time for a few weeks and read your paper thoroughly if you haven't been doing so. It will only take you a few minutes each day, and results will be surprising.

¶ Fall into line with the big body of successful men who are keeping in close touch with changing conditions, improved methods, and new machinery.

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFIOIENCY.

Canada's Departmental House for Mechanical Goods

Concerning the Lathe Work Feature in Patternmaking

By W. J. Horner

The writer first refers to the special nature of the patternmaker's lathe as distinct from that of the metal turner and even of that of the general wood turner, and then proceeds to discuss a number of practical considerations relative to the lathe equipment for holding the work, the preparation of the latter, and the various tools and their application in order to obtain the desired finished product.

IN the construction of foundry patterns there is a considerable amount of turned work. In some shops a professional woodturner does this, but as a rule the patternmaker does his own turning. In any case, the turning is so important a part of the trade and so inseparable from the bench work that it is done in the pattern-room, and a room that has not at least two lathes is poorly equipped for pattern work. Some patterns are done entirely in the lathe after the preliminary preparation of the wood at the bench; others have either the main portions or small portions turned. In a few cases there may be nothing circular or cylindrical about a pattern, and, consequently, no turning. Often the turned portions consist only of core prints, which are very common, as round holes for bolts and for other purposes are often wanted in castings. Turned bosses and facings are also common on patterns, which otherwise are made at the bench. Sometimes lathe work can be avoided by making plain circular parts at the bench, but turning is generally preferable, and even in the simplest patterns is occasionally unavoidable.

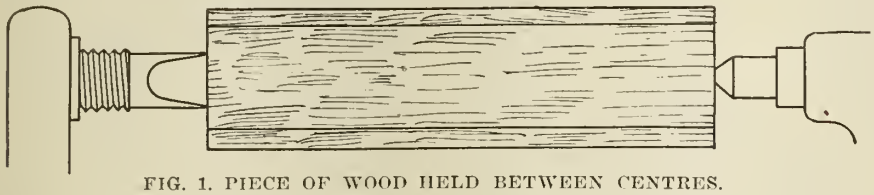

FIG. 1. PIECE OF WOOD HELD BETWEEN CENTRES.

The lathes used by patternmakers differ from those used by metal turners, and to some extent also modern specialization has made slight differences between patternmakers' lathes and those used for other classes of wood-turning. The patternmaker does more face-plate work than the general woodturner, and some of this is very large in diameter. Occasionally very great lengths and diameters between centres are turned; consequently lathes of large capacity are necessary, except in some few shops where work is uniformly small and medium in size. In no case can the work of a pattern-room be properly done in one lathe, because of the great variations in the size of work, some of which would be too large to go into a small lathe and some too small to be chucked and operated on conveniently in a large one. Besides this question of size, there is the consideration in all but the very smallest shops that, with only one lathe available, the work would be hindered through some men having to wait while the lathe was being used by others.

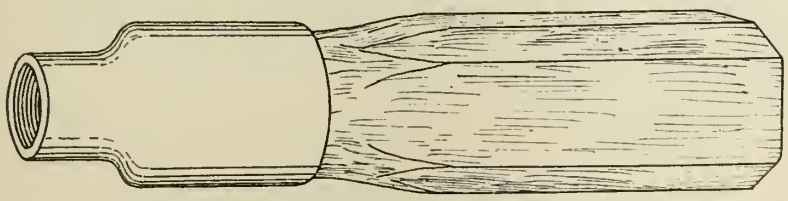

FIG. 2. PIECE OF WO OD IN CUP CHUCK.

Holding Work in the Lathe.

The way in which a piece of wood or of built-up work is secured in the lathe for turning depends on its proportions and the direction of its grain. If it be long compared with its diameter, it goes between centres, as in Fig. 1. If shorter, and if it be desirable to have its end free so that the tools can be used there, it is driven into the cup chuck or bell chuck, Fig. 2. If large in diameter and thin, and, consequently, having the grain running the other way, it is screwed to the face-plate, Fig. 3.

Fig. 4 shows the chucks separately. The fork centre being small, usually screws into the mandrel nose. The others screw on its outside. The fork centre is simply forced into the end of the piece of wood to be turned, and so compels it to revolve with the lathe spindle. At the other end the wood is supported by a plain dead centre and revolves on it, a few drops of oil being applied at starting to reduce friction. The point of the centre enters the wood about ⅛ in. to ¼ in. A centre hole is generally bored with a bradawl in each end of the wood before putting it in the lathe. When dealing with hard wood, a slot about ¼ in. deep by ⅛ in. or a little more in width is generally sawn across one end to facilitate the entry of the fork centre. The angles are pared or sawn from the piece of wood before putting it in the lathe. If it were turned down from the square it would dull the tools needlessly and be a loss rather than a saving of time.

The piece of wood in the rough should be two or three inches longer than the finished work to allow for cutting down at the ends. Between centres the turning cannot be carried completely to the axial line, but the work when otherwise finished must be taken out of the lathe and have the rough ends sawn off and the article finished by paring its ends with a chisel. It is here that the cup chuck method, Fig. 2, has some advantage over the between-centre method. It allows the outer end of the wood to be recessed or turned to any shape, and then the article can be cut off with a chisel while the lathe is running. Long pieces of wood do not run steadily enough at the outer end when held only in the cup chuck. Occasionally it is convenient to use it instead of a fork centre and bring the dead centre of the poppet up to steady and support the other end. The end of the wood is simply driven a tight fit into the cup chuck, being either pared with a chisel

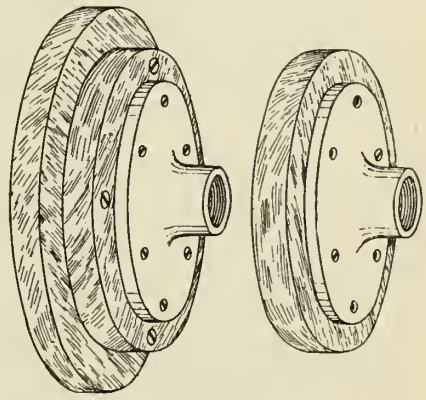

FIG. 3. PIECES OF WOOD SCREWED TO FACE PLATES.

before insertion or put between centres and turned to fit the chuck.

Face-plates.

Woodturners' lathes are provided with metal face-plates of different diameters, with countersunk holes for screws, by means of which the wood is held to the plate, Fig. 3. Generally, and invariably in large work, a wood plate larger in

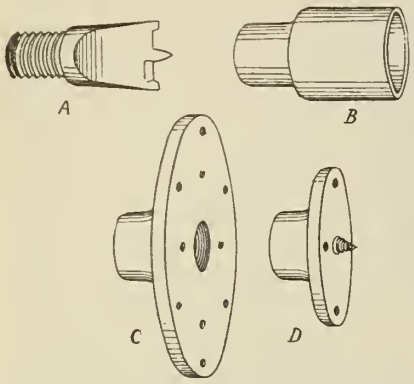

FIG. 4. CHUCKS USED IN WOOD-TURNING. A, FORK CENTRE; B, CUP CHUCK; C ORDINARY FACE PLATE; D, PLATE WITH TAPER SCREW FOR SMALL WORK.

diameter than the metal is screwed to the latter, and the actual work is screwed to the wood plate, as in the example to the right in Fig. 3. The advantages of this are that the work can be screwed at points far outside the diameter of the metal plate, and that the wood surface can be recessed if necessary to suit the work or have pencil circles marked to set the work by. Also, the cutting tools can be used right up to the surface of the plate without risk of injury to them, and so rechucking is seldom necessary.

Small plates for ordinary work consist of single pieces of wood, while large ones are built up, as in Fig. 5. A metal plate of such a diameter would be very heavy, and would not be so convenient for the rechucking and attachment of work; there is also the risk of injury to the tools when they have to cut close up to the surface of the plate. Most pattern work of large diameter is in the form of rings of various cross sections, which could not be screwed to a small plate. Screws are always used in preference to the methods of the metal turner. Small metal face-plates often have a taper centre screw solid on their face, as shown at (D) in Fig. 4. A piece of wood with a small hole bored in the centre can be screwed on to this, and is held securely enough if small, or a larger piece can have two or more screws put through the plate into it in addition.

Such plates are generally not fitted with a supplementary wood plate, but are used for the attachment of work direct, which is usually held only by the central gimlet-shaped screw. Plates without this screw are bored right through for the mandrel nose, as at (C), Fig. 4, and when a wood plate is put on them, a screw hole can be bored through the centre of it for small work, for which a screw in the centre only is sufficient to hold it for turning. Screw holes in work are as a rule not objectionable. Sometimes they are plugged after the work is finished, but frequently they are covered in fitting parts together, or sometimes can be utilized for permanent screws.

A considerable amount of work is glued to the plate instead of being screwed, the only objection to it being delay while the glue is drying. The wood is not glued direct, but with paper between. This holds securely, and when the work is finished it is prized off the plate with a chisel without injury either to work or plate. The glue does not lose its hold, but the paper splits and can be cleaned off after. All wood turned on the face-plate is sawn circular with an allowance for turning. A great deal has to be built up in segments. Wood plates

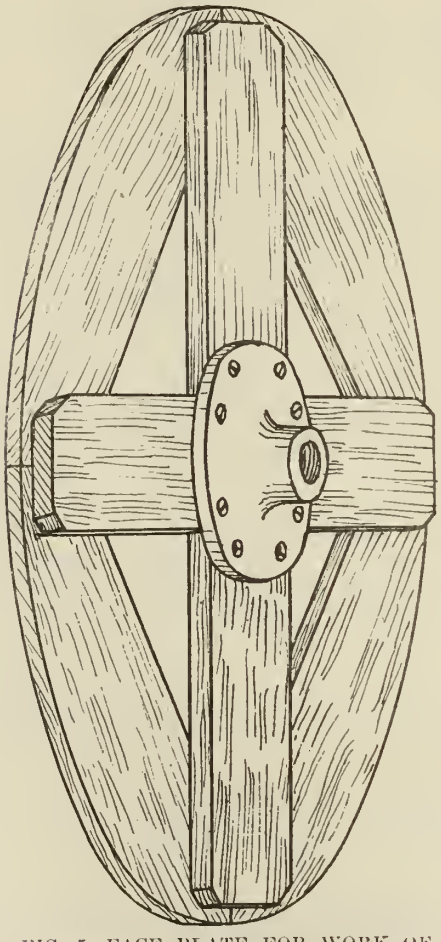

FIG. 5. FACE PLATE FOR WORK OF LARGE DIAMETER.

are trued up when they require it. Large ones are reduced as little as possible, and, when work has to be rechucked on them, it is done by putting on temporary pieces rather than turning a recess in the face and so spoiling it for other work. Small plates, being easily renewed, are recessed or reduced in diameter or modified in any way that happens to suit the work.

In screwing work to a plate, the screws are nearly always put through from the back, and are of a length which involves

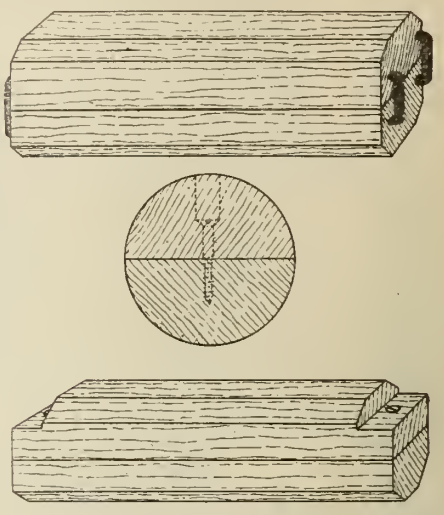

FIG. 6. METHODS OF USING STAPLES AND SCREWS FOR HOLDING WORK WHICH HAS TO BE TURNED.

no risk of their points being reached by the cutting tools. Some of the screw holes in the metal plate are occupied by screws, which hold it to the wood plate, but usually there are enough holes to allow some vacant ones for use if wanted for holding the work. Besides these, holes can be bored through the wood plate anywhere outside the diameter of the metal one. Wood plates may range in diameter from only slightly larger than the metal up to the largest that will swing over the lathe bed, while metal plates are always much smaller than the lathe capacity. Sometimes it is more convenient to screw work to the plate from the front. This can be done when screw holes are wanted through the piece of wood being turned, and when there is little or nothing to face off the front. Thus, thin pieces of wood are often planed to thickness and put in the lathe only to have their edges turned. In such cases they are often held by nails instead of screws, and are lifted off with a chisel when finished, or the nails may be only partly driven in and pulled out with pincers.

Work Turned in Halves.

A large proportion of pattern turning has to be in halves for convenience of moulding. Work can be turned solid and sawn through the middle afterwards, but for several reasons this is not satisfactory, and is seldom done, jointing before turning being preferred. Figs. 6 and 7 show ways of temporarily holding the halves together when such turning has to be done between centres. In Fig. 6 the upper example shows

halves held by staples or dogs. In large work these are used in addition to other means, and may occur along the sides as well as at the ends, being shifted and replaced as the turning proceeds. A stronger way is to screw the halves together with screws sunk low enough not to interfere with the turning. Screws at intermediate points in a long length must go into countersunk holes, as in the middle view, Fig. 6. At the ends it is generally better simply to notch out, as in the lower view. In any of these cases the lathe centres have to be adjusted as nearly as possible on the joint line. In screwing up, there is some tendency to force the joint open, and there is the probability of one or both ends getting more or less out of centre in relation to the joint, giving unequal halves.

For these reasons, centre plates, Fig. 7, are used for all heavy work in halves, and often for solid heavy pieces between centres. These are usually of metal, about ¼ in. thick, with four screw holes for screwing them to the ends of the wood. One plate has a slot for the fork centre, while the other has a countersunk hole to fit the dead centre. In large work, screws or staples may be used in addition to centre plates.

Another kind of centre plate for light work is not screwed on, but has points or prongs so that it can be hammered on and holds like a staple. When the work is screwed up between centres it is impossible for it to come loose, but absolute accuracy of adjustment in putting on the centre plates is not easy.

Work on the face-plate also has sometimes to be turned in halves, though not quite so frequently as that between centres. This, however, only means that each half must be screwed on with the joint across the centre of the plate. Such work nearly always consists of flanges, bosses, large prints, and other fittings to be attached to a larger pattern, as a complete pattern turned on a face-plate would usually be moulded on its flat, and, therefore, would not be wanted in halves.

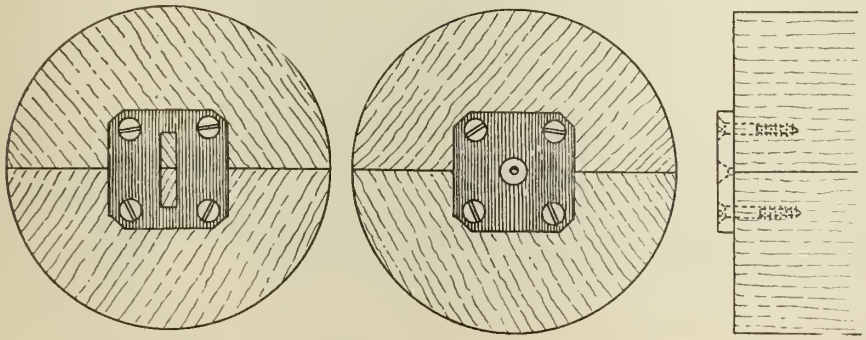

FIG. 7. HALVES HELD TOGETHER BY CENTRE PLATES SCREWED TO THE ENDS.

Tools and Methods of Working.

The tools used are not numerous compared with those required for bench work. The usual turning tools are shown in Fig. 8, but some of these are kept in different sizes to suit large and small jobs. The turning gouge is the most important tool, and is the only one used exclusively for cutting as distinguished from scraping. It reduces nearly to size, and then other tools remove the gouge marks and impart a smooth finish. The side chisel is used after the gouge on work between centres chiefly. It may be tilted to take a diagonal shearing cut, or used on edge for parting, or on its flat for scraping. It is ground on both sides. The firmer or facing chisel scrapes straight portions between centres or flat ones on the face-plate. The round-nose scrapes concavities. Convex portions are scraped with a chisel. The diamond-point scrapes right or left hand in places where a square-fronted chisel would not work. Sometimes separate right and left-hand tools are used instead of a diamond-point.

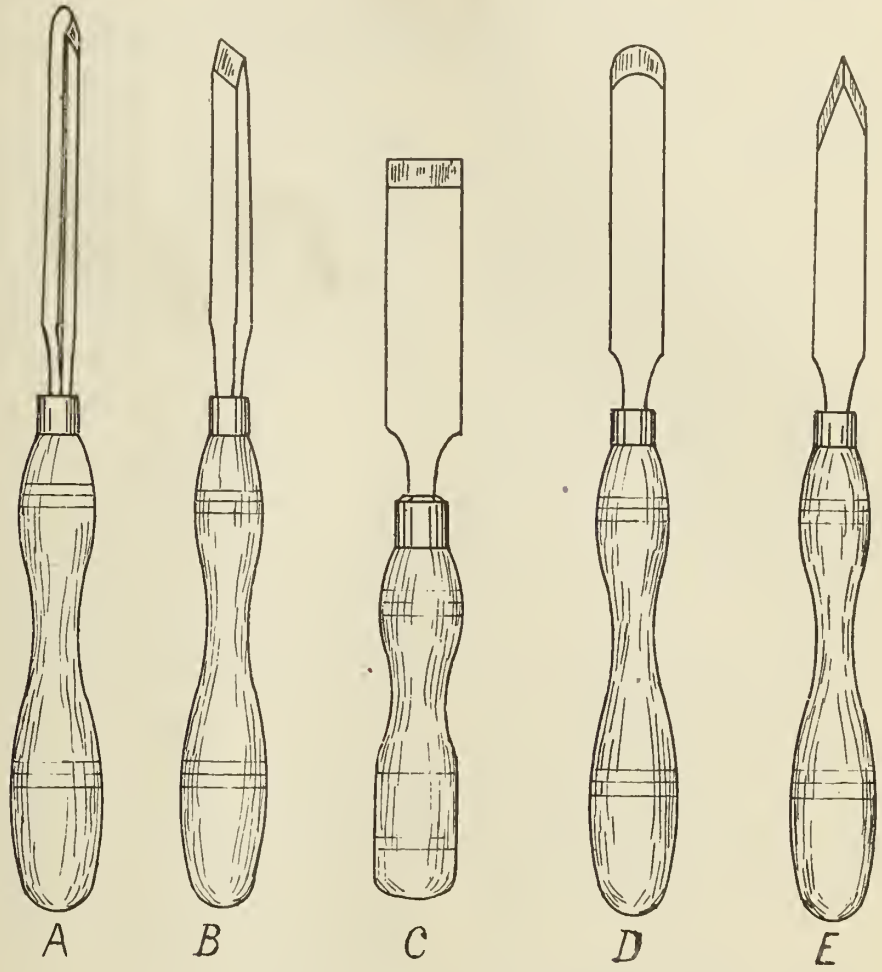

FIG. 8. CUTTING TOOLS USED IN WOOD TURNING.
A, Gouge; B, side chisel; C, facing chisel; D, round nose; E, diamond point.

Calipers and rule are used for measurement. Dividers and trammels are often used for marking lengths between centres or diameters on the face-plate, usually when a number are wanted alike. Otherwise such measurements are taken direct with a rule. Templets often have to be made to serve as guides for getting the correct shape. The pattern-maker usually works from drawing, and his work differs from ordinary wood-turning in having to be precise, accurate to size, curves to a definite radius, and straight parts absolutely straight or flat, with little or nothing that is ornamental or can have its contour judged by the eye alone. Moreover, there is very little repetition, and, consequently, standard templets or patterns to work from cannot be kept.

Templets are required chiefly for curves. They are cut from thin wood or thick paper, very often from glass paper,

a radius being struck with dividers, which cut through the paper, and so provide a templet instantly. Sometimes the templet is more complicated, but generally rule or calipers can be used for parts adjoining the curve. There are also cases where the curve is a complex one, having more than one radius, and not easily tested with separate templets for each radius.

Straight edges or the edges of steel squares are used, the same as in bench work, for testing the straightness of parts and as an assistance in measuring depths. Work for which templets are necessary is drawn full size in section on a board, and the templets tried on this before being used. This is chiefly in face-plate work, and in this also it is almost invariably necessary to build the work in segments or short arcs of circles glued up in layers with overlapping joints, to form a ring of the size and shape required. This is a question of jointing rather than of lathe work, and sometimes has to be done in work that is not turned.

QUITS PARTY ON IMPLEMENT DUTY QUESTION.

"I AM unalterably out of the Liberal party because I feel that the policy they are supporting is detrimental to the interests of a business in which I am not only deeply concerned, but in which I have a great human interest. I have stated the policy that I believe to be fair and just, not only to the concern in which myself and others are interested, but to the people of Canada. I intend to adhere to it, whatever other people do. I feel that the Liberal party has deserted me."

Such is the declaration made by Sir Lyman Melvin Jones, president of the Massey-Harris Co., Toronto, with repect to the endorsation by the Liberal party in the House of Commons of a resolution calling for the removal of duty from agricultural implements.

Favors Moderate Tariff.

"I will continue in the position which I have occupied for many years. I believe, as I have believed all along, that it is to the best interest of the country to raise its revenue by a moderate tariff, and not by direct taxation or a high tariff. I was born a Liberal, and while I do not pretend or boast about my political qualifications, I feel that I have always tried to act in the best interests of the people.

"I have never requested or desired a high protective tariff. I am not a free trader, and I do not approve of Canada raising its revenue by direct taxation. My opposition to such a policy is due to the fact that taking into consideration the existing relations between Canada and the United States, such an innovation would be impossible. I feel that if I adhered to the policy advocated by the Liberal Opposition it would ultimately prove disastrous to one of the greatest industries in Canada.

A Compromise Suggested.

"In my opinion it is one of the most absurd, ridiculous and unbusinesslike policies that has ever been brought up in Parliament. It is lamentable for many reasons, and I feel that the masses and a great many farmers really do not understand the absurdity of the issue. For many years the farm implement industry has been made the scapegoat. Had the party proposed a reduction of duty on subsidiary articles, such as steel, iron, bolts, nuts, and other things pertaining to the industry, which we are obliged to import, I certainly would have supported a plan calling for a slight reduction on farm implements generally."

In support of his contentions Sir Melvin Jones pointed out that when the late Government placed binder twine on the free list some years ago the industry was eventually annihilated in Ontario.

Sir Melvin states that he has not been interested in the binder twine industry for ten or twelve years, and that he made the comparison merely to demontrate that if the same treatment was accorded the farm implement industry in Canada it would ultimately disorganize and disrupt manufacturing interests that had played a prominent part in the developing of the great western prairies.

Looks for Better Times.

Briefly referring to the money stringency in Canada during the past couple of years, Sir Melvin pointed out that while the activity in the farm implement industry had not been as marked as five years ago, he was sufficiently optimistic to harbor a feeling that it would only be a matter of a short time before it would recover its normal place as of yore.

"I have watched the growth of the West from its infancy," concluded Sir Melvin, "and my whole life work has been devoted to helping to build it up. While the firm with which I am connected have helped the settlers to develop their homesteads, credit must also be given the merchant, the blacksmith and others who helped to shoulder the burdens of the new citizens."

A WASTE OF MONEY.

"IT would be an absolute waste of money to deepen the St. Lawrence River just because the Welland Canal is being deepened," said Sir Robert Perks, the English engineer and builder of public works, who arrived in Montreal from New York, last Friday morning, in the course of a conversation on Canada's waterway requirements.

Sir Robert said he still favored the Georgian Bay-St. Lawrence Canal scheme. He said that the Welland Canal-St. Lawrence route would cost more than double that of the Georgian Bay route; it would be much longer, while it would not be wholly under the control of the Dominion.

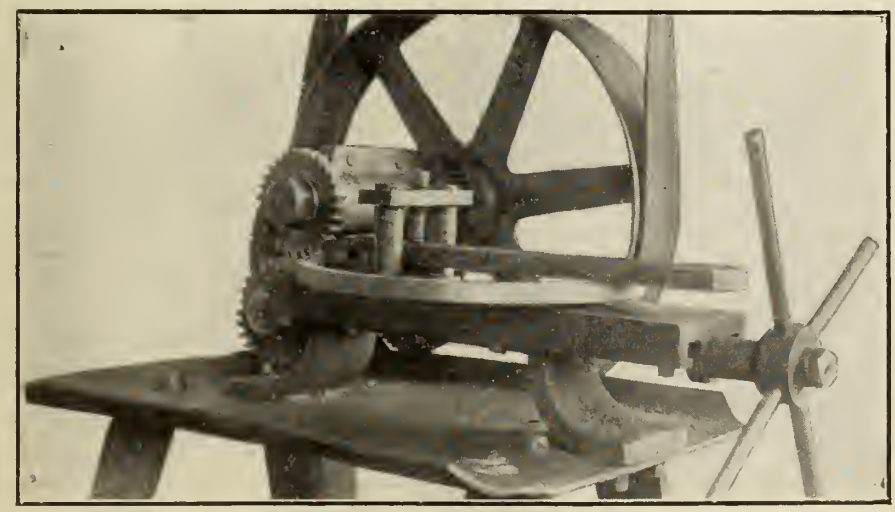
The Welland Canal - St. Lawrence route would cost $280,000,000, Sir Robert claimed. He further said the cost of deepening the St. Lawrence River so that ocean-going steamers could use it would be as much as the whole Georgian Bay Canal scheme, while permission to do it would have to be secured from the United States. He thought the Georgian Bay Canal and the English Channel tunnel were the two great outstanding engineering tasks that should be undertaken in the near future.

TORONTO HYDRO-ELECTRIC SYSTEM.

LAST year's business brought a net surplus of $34,576 into the coffers of the Toronto Hydro-Electric System, or approximately 3 per cent. on the total investment. The gross income amounted to $1,159,339.71 for the year, while the cost of current and the expenses of operation and management, including repairs and maintenance, absorbed $681,-217.01, leaving a net balance of $478,-122.70. The interest, depreciation, and sinking funds for the year amounted to $443,546.83. These figures show that the operating expenses were reduced 5½ per cent. from those of 1912, and the cost of current lower by 4 2-3 per cent., chiefly due to the reduced charge made by the Provincial Commission.

Notwithstanding the request of the Provincial Hydro Commission in regard to the reduction of rate, the report of the commission issued recently declares that a reduction of rates at this period in the development of the system would be unjustifiable. The statement points out that no complaint has been received from the customers relevant to the rates, but the commissioners state that whenever conditions warrant it, a reduction will be made, and say that it would be a breach of trust on the part of themselves to sanction any reduction before the financial condition of the enterprise justified it. "It is the policy of the commission to give in the first place a first-class service," reads the report, "and in the second place to give that service at the lowest cost possible. That policy will be strictly adhered to."

MACHINE SHOP METHODS AND DEVICES



Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SPLITTING PISTON RINGS.

D. O. Barrett.

THE photograph shows a machine for splitting piston rings where the lap point is used. This particular machine as shown is non-adjustable, the cutters being 4 inches in diameter and 9/16 inches wide. The upper cutter is placed about ¾ in. ahead of the lower one so that their teeth will not interfere and yet both cut to the same line. Spur gears are placed on the ends of the shafts next to the pulley to drive the lower cutter, while the table slides on a portion of the main frame, which is extended back to carry the same. The nut for the screw which is operated by the hand wheel is also carried in the frame.

At the back of the sliding table under the ring will be noticed a series of stops; these are arranged both at the front and the back, the stops varying in sixteenths, with every other step marked with the number of eighths corresponding. For instance, to split a ring ⅝ inches thick, the block is slid along until the step marked (5) comes into position. The back step is then placed so that (5) comes under the ring when the split will come central. The steps are held in position by springs which clamp over each side of the table. The

SPLITTING PISTON RINGS.

two posts at the front are slotted down the inside, and the long cold rolled steel bar has pins fitting these slots, which keeps it in position and prevents it from hitting the cutters. The clamp across the top is slotted so that it can be easily removed and replaced.

In the particular shop in which this was used, the same split was used on all the rings, namely 9/16 in. The machine was used for sizes from 8 in. to 18 in., and saved a great amount of time over other methods of splitting. It was possible to feed the work into the cutters quite rapidly, owing to the fact that the cut was taken both above and below. Had it been necessary, it would have been possible to adjust the spindles sideways so that varying widths of cutters could have been used.

FLYWHEEL QUERY.

By N. G. Near.

CONCERNING H. Westwood's query in the March 12 issue of **Canadian** Machinery, there is not sufficient information given to arrive at a very exact or even satisfactory solution. Much depends upon the design of the flywheel—number and type of arms, manner of casting, bolting, etc.

Bearing "average" conditions in mind, however, I would say that there is practically no change in tension on the hub bolts. There should be none, for the same reason that there should be no change in tension in cylinder cover studs, which has recently been so thoroughly discussed in **Canadian Machinery**. Most of the stress, in flywheels, caused by centrifugal force, must be borne by the rim bolts; it having been shown, for example, that in some designs there is absolutely no change in stress in the flywheel arms save that due to the centrifugal force of the arm itself. Of course, there are bending stresses set up, caused by acceleration and deceleration, but these will be neglected here. We will consider centrifugal force stresses only.

Applying the old flywheel formula $P = \frac{12\ W\ V^2}{G}$ where (P) is the tensile stress per sq. in. in the flywheel rim, (W) the weight of one cubic inch of the material of which the flywheel is made (0.26 lb for cast iron), V the velocity of the flywheel rim in ft. per sec., and G = 32.16 the acceleration due to gravity, we get, for Mr. Westwood's wheel 785 lb. per sq. in.

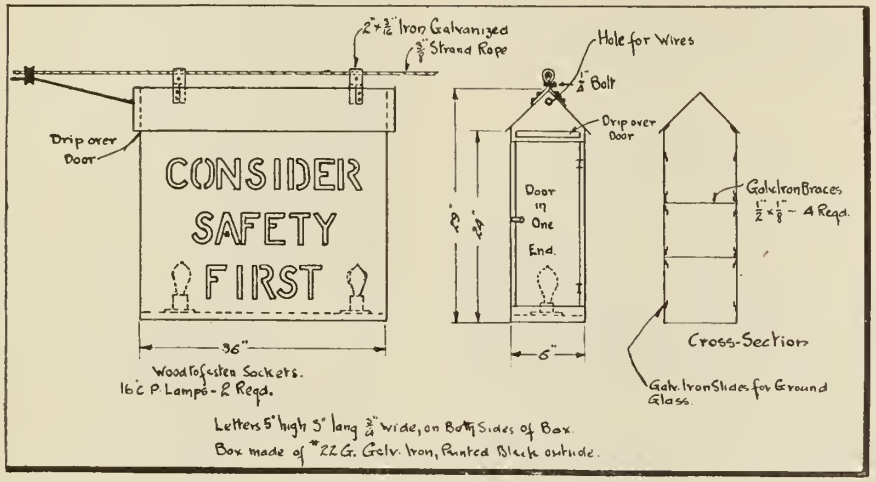
Assuming a ton to be 2,000 lbs. and, solving for the cross-sectional area of the rim, I get an area of 170 square inches. The total tension is therefore 785 lb. per sq. in. × 170 = 133, 600 pounds; the same to be held by two bolts or about 70,000 lb. per bolt, which is a whole lot more than should be allowed, inasmuch as the cross sectional area of each bolt is only about 3 sq. in., the unit stress thus being 23,000 lb. per sq. in.

I therefore contend that if Mr. Westwood's flywheel is an average design, the stress in the hub bolts will not change, whereas the stress in the rim bolts will increase about 69,000 pounds.

SQUARING ROUND HOLES.

By M. L. S.

AMONG the many little jobs of the so-called non-productive departments of our plants, the forming and fitting of hexagon, square, and other forms of sockets is often one of the most tedious and expensive. In a great many tool rooms, the process of making a drill press socket for a square shanked tap would involve first finishing the outside of the stock in the lathe and drilling a hole equal in diameter to the side of the square desired in the end. The hole would then be squared at the bench by means of chisels, drifts and files.



A very much better way, especially where many sockets are to be made, is to first drill the hole either in the lathe or in the vertical Vee block of the drill press and then have it drifted to the shape desired in the smithy. If this be done, by using a round nosed drift followed by one of the exact shape and size, at the proper heat and with the exercise of ordinary care on the part of the smith, a square can be secured fully as accurate and strong, and many times cheaper than by means of hand work of the average machinist.

The socket is next slipped upon a piece of square stock which has been previously trued up in the lathe chuck, the back end is centre drilled and the outside finished in the usual way.

A "SAFETY FIRST" SIGN.

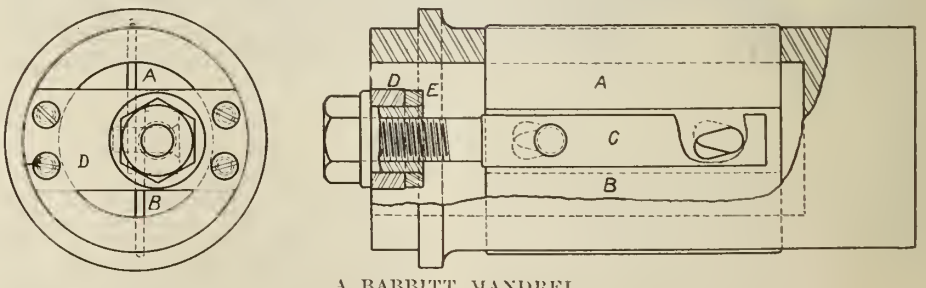
By J. H. W.

THE illustration shows a "Safety First" sign used at the Montreal Rolling Mills, where it is suspended between two buildings near the entrance to the works in such a way that teamsters, and others entering the plant, cannot fail to notice it. The sign is also displayed at awkward corners, over alleyways, approaching railway sidings, and at other places of danger.

SAFETY FIRST SIGN.

The sign consists of a metal box made from galvanized sheets, 22 W.G. thick, and painted black outside. The words, "Consider Safety First" are cut out on each side in letters five inches high by three inches long by ¾-inch wide. Each word occupies one line and is glazed with a piece of ground glass carried by light galvanized slides, as shown by the cross-section. The ground glass makes the wording very conspicuous by day, the letters contrasting strongly with the black paint. At night the sign is illuminated by two 16 c.p. lamps placed inside, the lamp sockets being screwed to a light board at the bottom of the box. The two sides of the box are braced together by four ½-inch by ⅛-inch galvanized iron braces, and a door is fitted at one end. The sign is suspended overhead by two light clips from a ⅜-inch galvanized wire rope, and, of course, is at a sufficient height to clear the highest load likely to enter the plant.

This device can be made up at small expense, and is very effective. It is in use at all the Montreal plants of the Steel Company of Canada, of which the Montreal Rolling Mills forms one.



A BABBITT MANDREL.

D. O. Barrett.

HAVING a large number of removable babbitt bearings to make, the mandrel shown was devised to cast the oil grooves directly in place. These were one-eighth in. wide and about one-sixteenth in. deep. Self centering caps were used at the ends of the bearings which were cast as a complete circle and, after babbitting, split to make two halves. These are not shown. A fillet was used only on the one end.

The mandrel was bored out to the depth of the bearing, and slotted on each side with a one-eighth in. saw, the cuts being on opposite sides of the centre so that the sides of the pieces (A) and (B) would be in line. Slots three-eighth of an inch wide were milled in these pieces at an angle of 15°, and long enough to give the necessary in-and-out movement. The bar (C) was fitted with pins working in these slots and, as the bar was moved in and out, there was a corresponding movement of the pieces (A) and (B). The mandrel was milled across the end to accommodate the piece (D) in which was located the nut.

The nut was turned down and the washer (E) riveted on the end after being passed through the piece (D). This held the nut firmly in position and prevented movement in either direction when turned. The washer under the nut was pressed on, in order to give more bearing surface under the nut. By turning the nut in the proper direction, the movement of the pieces (A) and (B) could easily be effected.

A BABBITT MANDREL.

AN ATTACHMENT FOR THE LATHE.

D. S. Mann.

IN visiting a machine shop lately, the writer noticed a attachment on a lathe that was new to him. This lathe was used a great deal on jobs in which both boring and turning were done; such as on as small pulleys, engine cross-heads, etc. A drive shaft was attached to the back of the lathe running along beneath the carriage and was driven from one of the gears at the head end. A sprocket was carried on this shaft, and was caused to slide along with the tailstock. This shaft was, of course, provided with a keyway the full length. Just inside the handwheel on the tailstock was placed another sprocket, normally loose and driven from the lower sprocket by means of a bicycle chain. One of the spokes in the handwheel had been drilled and a pin could be slipped through the same, fastening the sprocket and handwheel together when a power feed was provided. Boring bars were provided with a taper at the one end fitting the tailstock and were carried in a bushing in the spindle. These bars were slotted to carry the boring tools.

In this manner there was no connection whatever between the carriage and the boring tools, so that either could be manipulated as desired without in any way interfering with the other. Boring and turning could thus be carried on simultaneously with the proper feeds for each. To stop the boring operation, the pin in the handwheel was simply pulled out, and if this attachment were not to be used for some time, the gears were also disconnected.

BORING TOOLS.

By H. Womersley.

BORING bars and heads, like many other tools may be made in endless variety and must be suited to the work in hand. We give herewith a description of a pair of boring tools that, while

not new to some readers, still involve several novel features. Figure 1 represents the tool holding feature of a heavy boring bar. The tool (T) may be of any size or section desired and is held firmly in place by means of the plate (P) and the studs (SS). The slot for the tool may be easily machined in the shaper or otherwise, which, for large tools, obviates a very tedious operation.

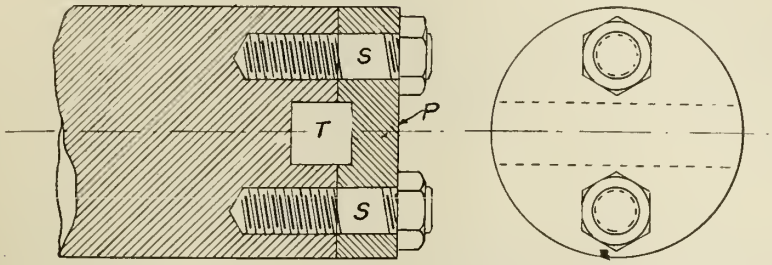


FIG. 1. BORING TOOLS.

In Fig. 2 is shown a boring head which may be attached to any style of shank desired. The four tools (T) are carried by slots in the head (H) and are fastened by means of the set screws shown. It wil be noticed that the tools are not placed in a common plane but are staggered so that each one will do a certain portion of the cutting. This device may be used for roughing by setting the tools at different distances from the centre, or may be used for finishing by grinding all the cutters to an equal radius.

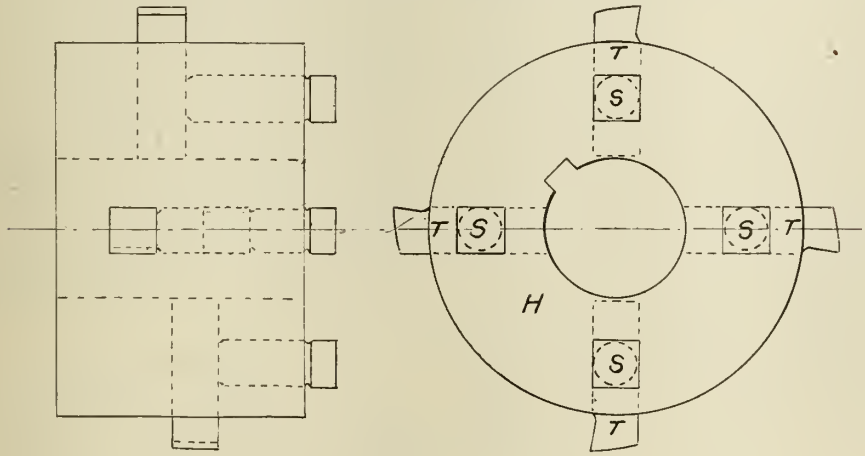

FIG. 2. BORING TOOLS.

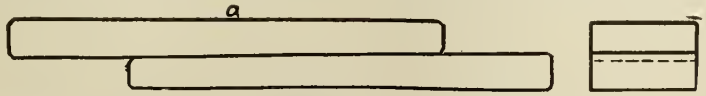


Editorial Note.—If the tools (T) were set with the cutting sides radial, the necessity of grinding them on top could be practically dispensed with.

FLYWHEEL KEYS.

D. S. Mann.

A MANUFACTURER building a line of oil engines used a flywheel key similar to that shown in the drawing. Strictly speaking, it consists of two keys, both tapering but with the tapers turned in opposite directions to make the two sides parallel. The taper is about one-eighth inch in six inches of length. Oil engines are subjected to frequent and quite violent pre-ignitions, often sufficient to crack the hubs of the flywheels. The side (a) of the one key is left dry, and is inserted in the wheel with the small end projecting about three-fourths of an inch, sufficiently to get at for driving in. The other side is then oiled as well as both sides of the second key, which is then driven in. This half is driven in with a sledge, the width being such that it will drive up to a little more than an inch. No fit is attempted at the top or bottom.

In removing the keys, the one-half is driven in, and is released by the taper. Great care must be exercised to get the keyways in both the wheel and shaft exactly the same width as otherwise the key is apt to exert a greater force on the hub then on the shaft, which is liable to result in a cracked hub.

FLYWHEEL KEYS.

Calgary, Alta.—A proposition is being considered by the city to erect an industrial building for the accommodation of small manufacturers desiring to locate here.

CANADIAN GENERAL ELECTRIC REPORT.

THE profit and loss account of the Canadian General Electric Co. for the year 1913 shows that the gross profits amounted to $2,029,898.60, as compared with $2,011,719.83, indicating an increase in business, notwithstanding the financial stringency that occurred in the country.

Out of the gross profits for the year the sum of $470,933.98 was applied to depreciation and $222,654.69 for interest, leaving the net profits for the year $1,336,309.93. From this dividends on the preferred stock and bonus on the common stock took $776,634.17, leaving surplus earnings for the year of $559,675.76.

Reserve Amount Increased.

Of this surplus, $328,134.05 was added to the reserve fund and $231,541.71 to the balance of the profit and loss account. As the balance at the credit of this profit and loss at the end of 1912 stood at $682,390.63, it had increased at the end of 1913 with the amount carried to it to $913,932.34.

The reserve fund now amounts to $2,700,000, and this with the amount standing at the credit of profit and loss made the total surplus at the end of 1913 $3,613,932.34, equal to 36 per cent. of the par value of the share capital of both common and preference. There has also been accumulated a reserve for depreciation now amounting to $1,537,605.42.

In connection with the inventory, the directors' report states that, following the policy of the company, this has been taken at cost or market value, whichever was the lower. Ample reductions have been made for depreciation, and any obsolete stock has been written down to scrap value.

Real Estate Advanced.

The real estate owned by the company has advanced in value since the date of purchase, but has been carried on in the books at the original purchase price. The services of the Canadian Appraisal Co. were obtained in 1913, to make a complete itemized appraisal, and the report shows the replacement value of the real estate, plant and equipment to be $3,200,000 in excess of the book values. From this amount they have deducted $1,271,685, leaving an excess value of $1,928,315.

In the previous year the company, under the headings of "patents" and "contracts," in its balance sheet, showed the item of $503,761.42, being their book value after depreciation had been written off from year to year. Included in this were the goodwill, the company's own patents, and the contracts and trade marks, which were

used in the conduct of the business. These being of intangible value, have been written down to the nominal sum of $1, thus increasing the value of the real estate by the amount written off patents and contracts, and allowing the balance of excess of the value of real estate, plant and equipment, amounting to $1,424,554.58 to remain as an inactive reserve.

ONTARIO'S OCEAN PORT.

ANY suspicion that Moose Harbor, on James Bay, could not become a great seaport was dispelled by Mr. J. G. G. Kerry, consulting engineer of the T. & N. O. Railway, in an interesting and illuminating address at the Science Building, Toronto, on March 26. Mr. Kerry submitted a number of facts concerning the position and nature of this harbor, to which the Government Railway is to be extended.

Need of Northern Development.

"Information as to the design of a great terminal is not complete, and much has yet to be secured before the design can be worked out without alteration." Mr. Kerry took the view that New Ontario, an unsettled district between two more settled portions of the Dominion, was the cause of a distinct east and a distinct west.

"The settlement and development of this portion is the most important national work now in progress in Canada," said the speaker. "The establishment of a commercial centre will assist greatly in the development. Moose Harbor is well located." Mr. Kerry pointed out its proximity to Toronto, Winnipeg, Montreal, and other large centres, adding that it was but twenty-four hours' run from Toronto.

Easy to Make a Harbor.

Referring particularly to Moose Harbor, the speaker said that the tides did not appreciably affect it, and that the average low tide depth was from 15 to 20 feet.

"The most serious proposition is the bar at the river mouth," continued Mr. Kerry. "My personal opinion is that if a channel be dredged it will be found that it will remain open. There is not sufficient silt in the river discharge to fill it in. It is not wise to look for an enormous growth in traffic at first, and a depth of 15 feet in the channel over the bar at low tide will be sufficient now, and more can be done as the traffic grows."

Season of Fair Length.

The length of the navigation season at Moose Harbor was only one month shorter than the season in Montreal, and ran from five and a half to six months, and this could be lengthened by the use of icebreakers. The Moose River went out with tremendous ice crushes in the spring, but these, under conditions very similar, have been mastered in Montreal and could be there.

Mr. Kerry estimated that 1,000 feet of crib wharf could be put in at a cost of from $125,000 to $150,000, and that a 15-foot depth channel could be dredged through the bar for from $500,000 to $600,000, making a harbor to start with, to be enlarged if traffic demanded.

ICE INFLUENCE ON WATER-POWER DEVELOPMENTS.

IT has been confidently predicted by a well-known engineer that at no distant date Canada will have not only transcontinental railways, but a transcontinental water-power system.

If this prophecy be ever fulfilled—and it would appear to be on the way—its realization will be in a large measure due to the work of men like Prof. H. T. Barnes, of McGill University, who gave a lecture last week, at the Engineers' Club, Toronto, on "The Influence of Ice on Water-power Developments."

Dr. Barnes is more or less of a theorist, and conducts his experiments chiefly from a scientific point of view, but his theories have proved very valuable in practice, and have been carried into effect in practical commercial undertakings. Mr. Murphy, of Ottawa, has admitted that some of the best results from experiments he has made in connection with power houses in winter have been based upon Dr. Barnes' theories.

The "Frazil" Trouble.

The problem which Dr. Barnes is at present engaged upon, and which he expounded by means of limelight illustrations, is to keep the great northern waterways open in the winter months. He showed by many photographs of ice formation in rivers and rapids how power plants were hampered by the accumulation of "frazil." This "frazil" is a formation which gathers in large, sponge-like masses in the beds of rivers, and rising to the surface, forces the upper ice above the water, and causes packing. Dr. Barnes' experiments included the idea of diagonal booms above the dam, and the forcing of hot air or steam on the surface of the water at the head of the dam.

He criticized the Government's handling of ice-breaking on the St. Lawrence River, and said that the Government thought they knew everything about ice-breaking. He declared that the present ice-breakers were useless, and that the Government had given an order for a new one to a firm that had never made an ice-breaker before.

CANADIAN FAIRBANKS-MORSE REPORT.

THE reactionary trend of business through 1913 is reflected in a marked degree in the annual statement of the Canadian Fairbanks-Morse Co., Ltd., which shows net profits of $224,792 against $390,303 in 1912, a decline of $165,511, or about 42 per cent.

Despite the sharp falling, the company was able to pay the regular 6 per cent. dividend on $1,500,000 of preferred stock, and the regular 8 per cent. dividend of $1,600,000 of common, and still have something to the good. The margin, however, was a small one, $6,792, as compared with $213,190 the previous year, surplus earnings available for common stock dividend working out to only 8.4 per cent. against 21.3 per cent. the previous year.

Although the company again demonstrates a strong position in the balance sheet, the business operations were naturally affected by the strain imposed by the financial stringency on all industrials, particularly those with important Western connections. A new item of $780,133 appears in current liabilities under the head of "bank and other loans," while current assets rose $176,324 to $3,902,901 last year. Current liabilities rose from $675,500 to $1,483,494. At the end of 1913 the excess of current assets over current liabilities was $2,419,407, against $2,918,583 at the end of 1912.

Passed Through Trying Year.

Mr. H. J. Fuller, president of the company, deals frankly with the situation in his annual report. "The conditions existing throughout Canada during the year 1913," says Mr. Fuller, "were very different from those of 1912. Whereas our facilities during 1912 were taxed to their utmost, which meant that the volume of business available was all we could take care of, it has only been with the greatest difficulty during 1913 that we have been able to equal the same volume. To do this has entailed increased expenses, and the increased competition and decline on values of raw materials and finished goods has slightly decreased our percentage of gross profit. These two items taken together account for the difference in profits as shown between this year and last."

Sanguine as to the Future.

Concluding, Mr. Fuller states: "The situation in Canada resulting from an over-exploitation of lands and real estate has reacted to a healthy basis, and although we shall undoubtedly go through a trying period of readjustment, yet with the easing of the money situation and the constant immigration there is no question as to the future of the country or of the share which this company will enjoy of its prosperity."

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

Question.—A vertical steel rod, 1½ inches in diameter, has a weight of 35,340 lbs. suspended from its lower end. What is the stress per square inch of cross-section of the rod?

Answer.—Find the area of the cross-section of the rod, and divide the load by this area. Thus:

$$\text{Area} = \frac{3.1416 \times 1.5 \times 1.5}{4} = 1.767 \text{ sq. in.}$$

$$\text{Stress} = \frac{35340}{1.767} = 20{,}000 \text{ lbs. per sq. in.}$$

* * *

Question.—A hoisting drum is three feet in diameter. How many revolutions will it make in winding up 100 feet of rope. The drum is to be considered as being wide enough to take all the rope in one layer—no overlapping.

Answer.—The drum in one revolution winds up

$3.1416 \times 3 = 9.4248$ ft. of rope,

therefore, to wind up 100 feet it must make

$$\frac{100}{9.4248} = 10.6 \text{ revolutions.}$$

* * *

Question.—A locomotive has driving wheels 66 inches in diameter. If the wheels slip 22 revolutions per mile, how many revolutions do they actually make in four minutes when running at thirty miles per hour?

Answer.—At 30 miles per hour, the distance covered in four minutes is:

$$\frac{30 \times 4}{60} = 2 \text{ miles.}$$

In two miles there are 10,560 feet, and the number of revolutions made by the 66-inch (5½ feet) wheels in this distance, including slippage, is

$$\frac{10560 \text{ ft.}}{3.1416 \times 5.5 \text{ ft.}} + (2 \times 22 \text{ revs.}) = 655.18$$

revolutions.

* * *

Question.—A railroad car wheel, 42 inches in diameter, is found to be three pounds out of balance at a radius of 18 inches. What will be the "hammer blow" on the rail at every revolution when running at 30 miles per hour?

Answer.—There are 5,280 feet in one mile, and the number of revolutions made in one mile by a 42-inch (3½-feet) wheel is

$$\frac{5280}{3.1416 \times 3.5} = 480 \text{ rev. per mile.}$$

The car travels one mile in two minutes, and therefore the revolutions in one second are

$$\frac{480}{2 \times 60} = 4 \text{ revs. per second.}$$

The hammer blow on the rail will be the centrifugal force of the unbalanced weight, and this centrifugal force (F) is expressed by the formula:

$$F = \frac{Wv^2}{gR}, \text{ where}$$

F=the centrifugal force in lbs.

W=the unbalanced weight in lbs.

v=the velocity of the revolving unbalanced weight in feet per second.

R=the radius (in feet) of the path in which W travels, =1.5 feet.

g=acceleration due to gravity, =32.2.

The only one of the above factors not yet known is the volocity (v), but since the wheel makes 4 revs. per second,

$v = 3.1416 \times 3$ ft. $\times 4 = 37.7$ ft. per second.

Then the hammer blow on the rail is

$$\frac{3 \times 37.7 \times 37.7}{32.2 \times 1.5} = 88.27 \text{ lbs.}$$

* * *

Question.—Find the weight of a hollow cast iron cylinder 30 inches long, 18 inches outside diameter and 14 inches inside diameter. Cast iron weighs 0.26 lbs. per cubic inch.

Answer.—To find the number of cubic inches of metal in the cylinder, subtract the inside area of the cylinder from the outside area, and multiply the result by the length of the cylinder. Take all dimensions in inches and the result will be in cubic inches. Next multiply the cubic inches by 0.26, and the answer will be the weightof the cylinder in pounds.

Area of 18 inches=$.7854 \times 18 \times 18 = 254.47$ sq. inches.

Area of 14 inches=$.7854 \times 14 \times 14 = 153.93$ sq. inches.

Weight of cylinder is

$(254.47 - 153.93 \times 30 \times .26 = 784.2$ lbs.

* * *

Question.—How many Imperial gallons of water are contained in a rectangular tank, 6 feet long by 4 feet wide by 8 feet deep? One Imperial gallon occupies a space of 0.16 cubic feet.

Answer.—The cubic contents of the tank are

$6 \times 4 \times 8 = 192$ cubic feet,

therefore contents $= \frac{192}{0.16} = 1{,}200$ gals.

* * *

Question.—A cylindrical welded steel tank, open at the top, is made of ¼-inch plate. It has an internal diameter of 36 inches and an inside depth of 5 feet. It is filled to a depth of 50 inches with sperm oil, weighing 8.81 lbs. per gallon. Steel plate weighs 0.283 lbs. per cubic inch, and one gallon occupies a space of 277,274 cubic inches. or 0.16 cubic feet. What is the combined weight of the tank and its contents?

Answer.—Since the tank is welded, there are no rivets, lap joints or angle irons to be considered. First calculate the number of cubic inches of metal in the tank. The thickness of the tank is ¼ inch; therefore, the mean diameter is 36¼ inches, and the number of cubic inches in the vertical walls of the tank is

$3.1416 \times 36.25 \times 60 \times .25 = 1708.25$ cub. ins.

To this must be added the base of the tank, or

$.7854 \times 36.5 \times 36.5 \times 25 = 261.58$ cub. ins.

The weight of the tank is therefore

$(1708.25 + 261.58) \times .283 = 557.46$ lbs.

The space occupied by the oil is

$.7854 \times 36 \times 36 \times 50 = 50894$ cub. ins.

And the number of gallons in this space is

$$\frac{50894}{277.274} = 183.5 \text{ gals.}$$

The weight of the oil is

$183.5 \times 8.81 = 1616.63$ lbs.

Then the total weight of tank and contents is

$557.46 + 1616.63 = 2174.09$ lbs.

* * *

Question.—A stationary engineer has a cylindrical oil storage tank 24 inches inside diameter. It has a flat bottom, and on measurement he finds the depth of oil remaining in the tank to be 18⅜ inches. How many gallons of oil has he in the tank? Consult the previous question for the number of cubic inches in a gallon.

Answer.—The number of cubic inches of oil is

$.7854 \times 24 \times 24 \times 18.375 = 8312.66$ cub. ins.

Then, the number of gallons in the tank is

$$\frac{8312.66}{277.274} = 30 \text{ gals. (nearly).}$$

* * *

Question.—What weight can be raised by a single geared steam winch, of which the following are the particulars? It has two double acting steam cylinders, 8 inches diameter by 10 inches stroke; mean effective steam pressure in cylinders, 90 lbs. per sq. inch; number of revolutions per minute of engine shaft, 120; pinion on engine shaft, 16 teeth; gear wheel on winch 180 teeth; diameter of winding drum, 15 inches. The overall efficiency of the whole machine is 40 per cent.

Answer.—The horse-power developed by the engine is

$$\frac{2\times90\times.7854\times8\times8\times10\times240}{33,000\times12} = 54.8 \text{ h.p.}$$

This is equal to 54.8×33,000=1,808,400 ft. lbs. of work per minute.

The gearing has a ratio of 16 teeth to 180 teeth; so the number of revolutions per minute made by the winding drum is

$$\frac{120\times16}{180} = 10.66 \text{ r.p.m.}$$

Therefore the load is raised at the rate of

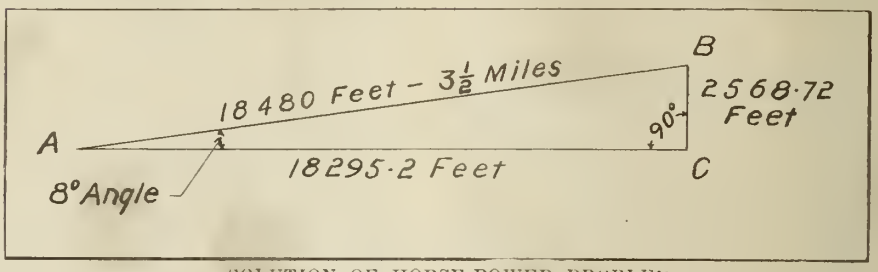
$$\frac{3.1416\times15\times10.66}{12} = 41.86 \text{ ft. per min.}$$

By the "Principle of Work" the work put into a machine is equal to the work absorbed by the machine plus the work given out by the machine; and the work put in, as found above, is 1,808,400 ft.-lbs. per minute. We are told that the efficiency of the machine is 40 per cent. In other words 60 per cent. of the work put in is absorbed in overcoming friction, so the useful work got out of the machine is only

$$\frac{1,808,400\times40}{100} = 723,360 \text{ ft.lbs. per min.}$$

We have seen that the weight is raised at the rate of 41.86 feet per minute; therefore the weight which the winch can raise at this speed is the number of ft.-lbs. of work got out of the machine in one minute divided by the number of feet through which the weight is raised in the same time, or

$$\frac{723,360}{41.86} = 17,280 \text{ lbs.=weight raised}$$



* * *

Question.—A car of 20,000 lbs. weight ascends an inclined plane of 8 degrees grade, 3½ miles long, in 15 minutes. If the friction be 3 per cent. of the load, what is the horse-power absorbed?

Answer.—Referring to the diagram herewith, let the triangle (ABC) represent the inclined plane. The angle at (A) is 8 degrees, and the distance (AB) is 3½ miles, or 18,480 feet. Now, the total work done in moving the car to the top of the incline is equal to the work done in moving it against friction through the horizontal distance (AC), plus the work done in lifting it through the vertical height (BC); consequently the first thing to do in seeking a solution is to calculate the lengths of the sides (AC) and (BC) of the triangle. Find (AC) first.

Cos. A = Cos. 8 = .99, but Cos. A $= \frac{AC}{AB}$, therefore $\frac{AC}{AB} = .99$.

AB = 18,480 feet, therefore $\frac{AC}{18,480}$ = .99, and AC = 18,480×.99 = 18,295.2 feet.

SOLUTION OF HORSE-POWER PROBLEM.

Next find the height of the side BC, $\frac{BC}{AB}$ = Sin. A = .139, therefore

$\frac{BC}{18,480}$ = .139, or BC = 18,480 × .139 = 2,568.72 feet.

Now, the work done against friction is 3 per cent. of 20,000 lbs., or 600 lbs., moved through the distance (AC), or 18,295.2 feet, and this amount of work is equivalent to

600×18,295.2 = 10,977,120 ft.-lbs.

Again the work done in lifting the car through the height (BC) is 20,000 ×2,568.72 = 51,374,400 ft.-lbs., therefore the total work done is 10,977,120+ 51,374,400 = 62,351,520 ft.-lbs.

This amount of work is done in 15 minutes; therefore the work done in one minute is $\frac{62,351,520}{15}$ = 4,156,768 ft.-lbs., and the horse-power exerted is

$$\frac{4,156,768}{33,000} = 126 \text{ h.p. (nearly).}$$

* * *

Question. — How long must a mild steel bar be so that, if lowered vertically into the sea, it would break with its own weight?

Answer.—Consider a cross section of 1 square inch. One foot of steel one inch square weighs 3.4008 pounds, and has a breaking strength of 60,000 lbs., and one foot of sea water one inch square weighs .4461 pounds. The net weight of 1 ft. of steel of 1 inch cross section when immersed is therefore, 2.9547 pounds, and the length necessary to produce a stress of 60,000 pounds would be $\frac{60000}{2.9547}$ or 20,318 feet.

* * *

Question.—The ram of a hydraulic elevator is 10 inches in diameter. The unbalanced weight of the elevator is 500 pounds. What hydrostatic pressure would be required to raise 2½ tons?

Answer.—Total pressure on ram is 5500 pounds. Area of ram cross section is 78.54 sq. ins., therefore 5500 pounds distributed over 78.54 sq. in. would require a pressure of $\frac{5500}{78.54}$ = 70.028 lbs. per sq. in. or approximately 70 pounds per sq. in. in the receiver tank.

Question.—A Prony brake, with a lever arm 5 feet long was applied to a pulley running 275 revolutions per min. The lever was found to balance at 70 pounds on the scale pan. How much power did the brake absorb?

Answer.—Applying formula

$\frac{2\Pi r\times W\times N}{33000}$ = h.p., in which

r = length of brake arm
W = weight on scale pan
N = r.p.m. of pulley, then

$$2\times\frac{22}{7}\times\frac{5\times70\times275}{33000} = 18.66 = \text{h.p.}$$

* * *

Question.—A 48-inch cylinder is to be bored. How many revolutions per minute should the table of the mill make in order to give a cutting speed of 50 feet per minute?

Answer.—Circumference of 48-inch circle would be 48×3.1416 = 150.7968 inches, and number of revolutions required =

$$\frac{50\times12}{150.7968} = 3.97 \text{ or approx. 4 r.p.m.}$$

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

UNIVERSAL CAM MILLING MACHINE.

THE Rowbottom universal cam milling machine, built by the Rowbottom Machine Co., of Waterbury, Conn., has embodied in its design many original features. It is the first cam cutting machine that has the cutter head mounted on a vertical slide, and is claimed to be the only machine that will cut all styles of cams in general use without the addition of extra attachments. The advantages derived from the vertical cutter head construction are as follows:—

The roller which controls the movement of the cutter slide is held in contact with the master former by gravity, so that the cutter cannot crowd or creep away as it is liable to with the horizontal cutter slide. All chips produced in cutting fall away from the work as fast as produced. Flat master cams are used for all style cams, whether box, face, drum, or side cams. These master cams may be increased in size to ease off the working angles in cams that have steep rises; the difference between master and work being adjustable by master roll bracket. The accompanying photographs illustrate the general design, and show the arrangement for cutting the various styles of cams.

The machine is driven by single belt from a two-speed countershaft; other speed changes for work and cutter spindle being attained by change gear levers. There are four speed changes to both the cutter and work spindles controlled by gear levers and, through the medium of the two speed countershaft, make eight cutter speeds and eight speeds of feed. Both the work and cutter spindles can be run in either direction independent of each other, making it possible to use either right or left

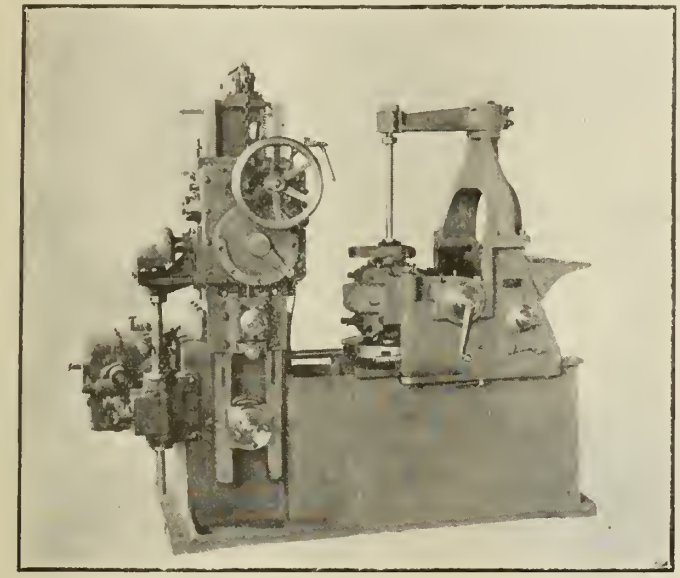


FIG. 1. UNIVERSAL CAM MILLING MACHINE.

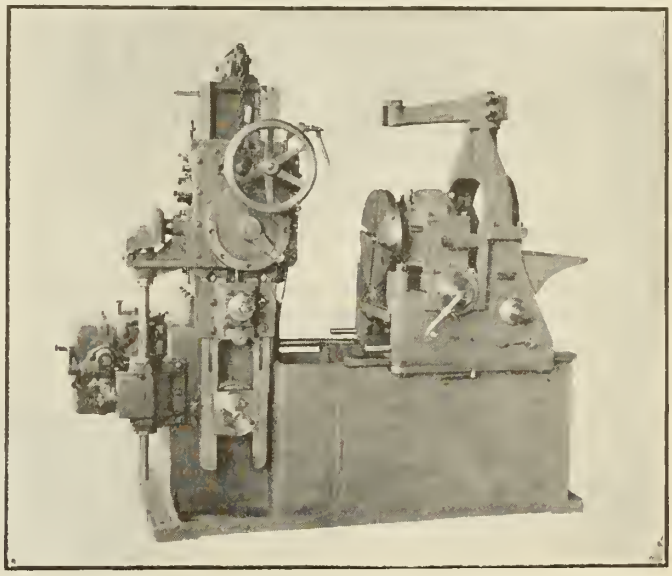

FIG. 2. UNIVERSAL CAM MILLING MACHINE.

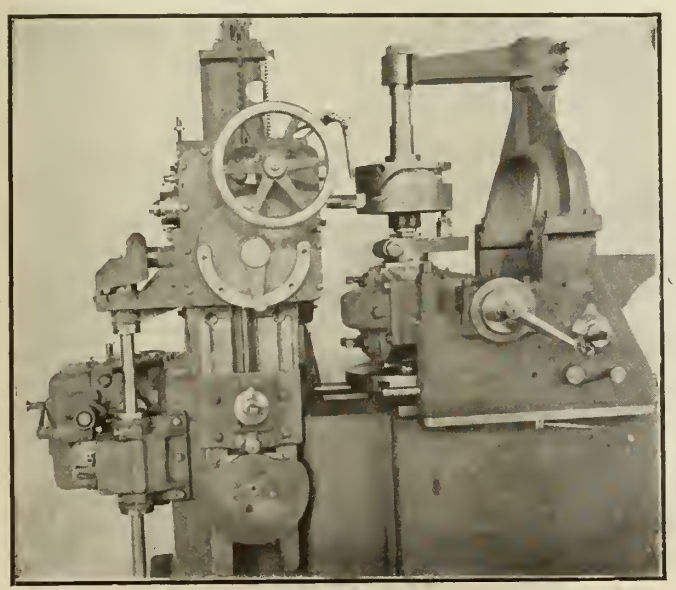

FIG. 1A. UNIVERSAL CAM MILLING MACHINE.

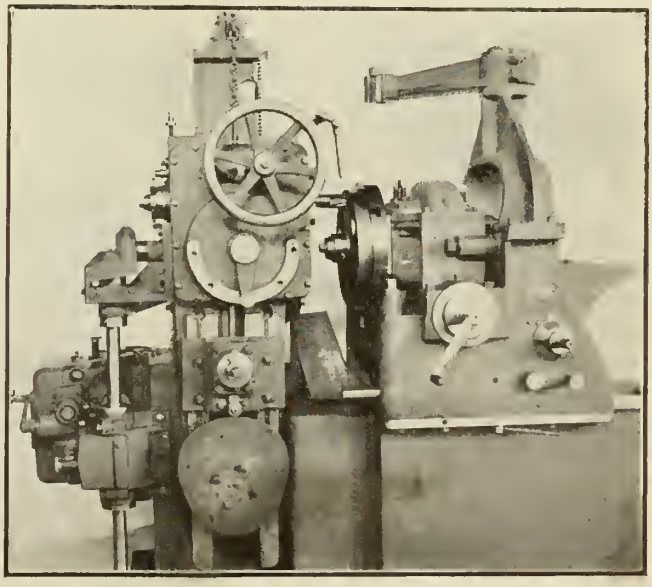

FIG. 2A. UNIVERSAL CAM MILLING MACHINE.

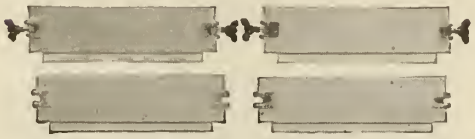


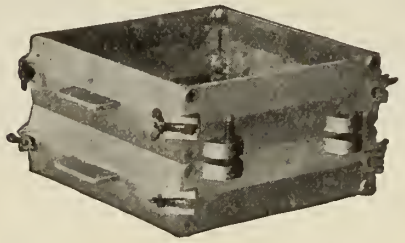
hand cutters, while the feed can be run in the direction best suited for the style of cam, or shape and angle of groove to be cut.

The cutter spindle slide operates vertically, following the shape of the master cam by its own weight, regulated by counterweights. The master cam is mounted on the end of spindle which revolves between the two extended guides of the slide, below the cutter gear box. Between the master cam and cutter gear box is an adjustable bracket carrying the follower roll of the master. This bracket is adjustable on the slide extensions and connected to the main part of slide by an adjusting screw and operated by crank handle. Through this adjustment the cutter spindle is brought to the required radius on the cam and measured off directly by the pointer and scale on the left side of cutter head and, with the micrometer dial on roll bracket, measurements to one thousandth of an inch can be attained. The slide can be raised quickly by hand wheel and held by ratchet and pawl in any position desired while changing cutters. All cutter driving gears are of steel and heat treated.

The work head has a lateral motion on the bed to and from the cutter by hand crank levers. This also is provided with micrometer dial for the direct and accurate measurement of the depth of groove to be cut. The work spindle is instantly separable from the driving mechanism and master cam, when desired to turn the work by hand for adjusting the cam blank to the most accurate position in relation to the master, it having an angular adjustment as fine as one-quarter degree of the circle.

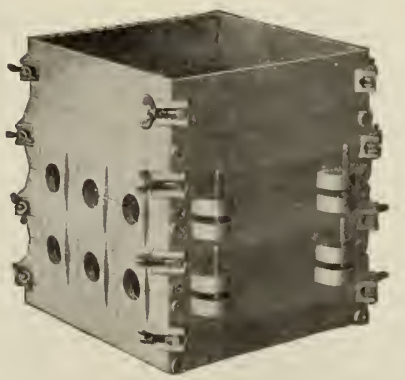
Figs. 2 and 2A, show the machine with the work spindle parallel with the cutter spindle, and the spindle bearing bolted rigidly to the upward extension of the work head at the back. This is the arrangement for cutting face or box cams, the work being secured to the face plate, which is a solid forging with the spindle, and provided with No. 12 B & S taper hole for work arbors. The under part of face plate is provided with a bearing as shown, which adds greatly to the rigidity of the machine. There are no overhanging parts except the cutter and work which cannot be avoided.

Figs. 1 and 1A, show the machine adapted for cutting cams of the drum and side type. The work spindle bearing is rotated forward on its trunnions through an angle of ninety degrees and securely bolted to the front part of the work head. This brings the axis of the work spindle vertical, presenting the other end of spindle as a working end. This end also is provided with a No. 12 B & S taper hole for arbors, and an arm to carry the driving stud. The vertical arbor is supported at the upper end by an overhanging arm which is easily detached from the arbor by a slip bushing; and then swung out of the way.



UPSET SHOWING FLANGES WITH 9 DEGREE OF TAPER.

Drawback bolts through the spindles are provided for the cutter and work arbors, and an oil tank and pump with flexible tube are supplied when desired for steel work. The weight of machine complete with countershaft is 4,500 lbs.



KNOCK-DOWN FOUNDRY FLASK.

EVIATING from the beaten path of improvements in foundry equipment, the Federal Foundry Supply Co. of Cleveland, has evolved and put in the

TWO-PART FLASK WITHOUT UPSET.

market a serviceable built up flask that will, no doubt, fill a long felt want in many brass and aluminum plants. This flask known as the A and D adjustable and interchangeable tight iron flask, is made in 18 different sizes. By knocking down and making rearrangements of ends and sides, 2,187 different sizes of flasks can be produced.

THREE-PART FLASK WITH UPSET ATTACHED.

The difficulty heretofore encountered —that of fastening the elements quickly and strongly together, seems to have been satisfactorily overcome by the use of a combination of pins, swivel bolts and wing nuts. The A & D flasks are constructed of cast iron, the parts being machined with jigs and to gauges, so that, should a breakage occur, the piece may be replaced at a fraction of the cost of a complete flask. The pins, swivel bolts, etc., are made of rust and corrode-proof Aero Metal, and so attached that no parts can be mislaid or lost as would be the case with loose bolts and nuts. Checks and upsets are also furnished in widths of 1 in., 2 in., and 3 in., and are interchangeable with copes and drags.

The knock-down feature permits of a minimum of storage room, and, if ordinary care be exercised in keeping the different sizes in proper order, the assembling should be done by common labor and in much less time than that required to readjust and repair wooden flasks. While the A & D iron flask is made in sections, it is claimed to be just as rigid as a solid flask and should commend itself just as thoroughly to multiple work as to jobbing.

The A & D snap flasks are made entirely of aero metal and are claimed to be 30 per cent. lighter than wood flasks of equal capacity and are certainly much more rigid. They are also built up of interchangeable parts with no loose pieces, thus greatly simplifying the repair problem. Five different sized ends and nine different sized sides allow of making up forty-five different sized snaps.

"Manitoba Engineer."—The 1914 number of the Manitoba Engineer, published by the Engineering Society of the University of Manitoba, has just been issued, and is a very comprehensive work. The issue contains several articles of live interest, particularly among those engaged in engineering and associated professions. The articles are well written, many of them being from the pen of men of high standing in the actual practice of engineering, architecture and surveying. The contributions are set off with numerous illustrations. The contents include the live topical questions of the day, and they are dealt with in a clear, concise and business-like manner. The article on road administration in the Province of Manitoba by A. McGillivray, Provincial Highway Commissioner, tells of the beneficial results to be derived from the construction of good roads. An article on New Manitoba and its mineral possibilities is contributed by Dr. R. C. Wallace. Street Illumination is dealt with by Prof. E. P. Fetherstonhaugh, and fireproof building construction by Thos. M. Goodrich. There are also articles on railway construction, and other topics

SYSTEMATIC BUSINESS MANAGEMENT

Practical Articles for Managers, Superintendents, and Foremen, to Assist in Carrying on the Business Economically and Efficiently.

SAVING TIME IN THE TOOL ROOM.

AN ingenious method of diminishing the time required to secure a tool from the tool room was recently devised by a tool boy in a shop in England. The usual practice in this shop had been for the workmen, whenever they needed a tool, to signal the tool room by means of an electric call bell, push buttons being located at convenient places throughout the shop. A messenger then answered the call, ascertained what was needed, and returned to the tool room for the tool, thus necessitating two trips for each call.

The new scheme comprised placing a blackboard at each push button in the shop, in such a location that it was in clear view of the tool room. The workmen would write on the board the name or symbol of the tool desired, and then signal the tool room. By means of a pair of opera glasses, the tool room attendant read the writing on the blackboard, and a messenger was dispatched at once with the tool, thus eliminating one trip.

EFFICIENCY FROM CENTRE TO CIRCUMFERENCE.

MR. C. W. DICKINSON of the Pittsburgh Dry Goods Co., addressing the jobbers section of the Dry Goods Association in New York recently, said that "efficiency must begin in the directors' room, in the case of a corporation, or in the managing partner's room, if a firm." Continuing, he stated that success in business depends primarily upon the ability of the executives, and if they are not efficient, the workers cannot be expected to do their best. This argument also applies with equal strength to the department managers, as in my opinion, it is imperative that all department heads should have ability to handle the men under them.

How can we acquire this ability? We can do it by educating and equipping ourselves so that we are at all times ready and able to assist those among us who may be in need. We must first consider our subject; then we can describe it and discuss it intelligently.

Returns Proportional to Giving.

Another fact I want to make plain is that a man can get out of life only what he puts into it. By this I mean the knowledge he can absorb and apply. Success is largely a matter of mind, consequently we need to educate and enlighten our under-men. We must help to create in them a desire to grow and to become more efficient in order that they may rise to a higher position and be of greater value to themselves and our organizations.

To advance, a man must outgrow his position—he must be bigger than the job he holds. It must be borne in mind, however, that he cannot be educated and equipped in a week, or a month, or a year, and we must not encourage a man to expect quick results without application, but must make him understand that only as he fits himself for higher positions can he expect to find them.

We who are at the head of an enterprise are responsible for the men under us. We should remember that just as we once looked to our superiors for sympathy, commendation, etc., so also do they look to us. We must not be nickel-wise and dollar-foolish, but must remember that a broad and liberal policy is the one that wins to-day. We are all human, and everyone of us can, and does make mistakes. When our employees make mistakes we should teach them not to repeat their error, show them what the mistake means and turn it into a valuable asset.

The public is the judge of service, and this is emphasized by the fact that service, more than any other factor, is what has built up the big organizations of to-day. We thing we know when we give proper service, but only our customers can decide the question finally. One of our great problems is to get the right kind of people and to select the ones who will take more than an ordinary interest in their work. Such people are difficult to find. We cannot get them away from other employers, except in individual cases, because the men who have such help usually appreciate it, therefore we must look ahead.

According to my view, the best way is to take the juniors (the raw material), and fashion them by educating and equipping them for the call that is sure to come. If we do this, we start them right; they get our ideas from the beginning; they have nothing to unlearn, and, in the long run they will make the best and the most efficient help we can hope to secure. We must teach our employees as to values, and must show them, when we can, how goods are made. Tell them all we can of the process of manufacture and everything that is, in any way, connected with the duties they are to perform. Then when they undertake to make a sale, they are equipped as well as it is possible for us to equip them.

Business Attributes.

Efficiency is a big subject, but there are other things that make for a salesman's success. One of the most important of these is courtesy. I call it the business lubricant, because it is a vital necessity. Another is promptness. We live in rapid transit times and new conditions are arising daily. Promptness means, in many cases, ability to meet these new conditions.

I might also mention loyalty. This is one of the attributes, the lack of which we cannot excuse. No man can put forth maximum effort without loyalty. A man may be incompetent, but if he is loyal we can get something out of him. We can, at least, trust him. But the man who is competent and disloyal, we have no use for.

Finally, we must realize that no one department is the whole thing and that the organization is made up of many units. The realization of this fact makes for harmony, whereas discord makes for inefficiency.

EFFICIENCY ENGINEERS.

"THE SILENT PARTNER" for February contained an editorial commenting on the herd of "business doctors" who are flooding the country with their "cure all" literature.

What "The Silent Partner" says is true enough, but don't let us lose sight of the fact for a moment that there is any difference between efficiency and any other profession. We have our grand doctors of medicine, gold-brick artists, chicken-coop architects, grafting politicians and fakirs of all kinds, consequently all that one need do is to take the destructive article appearing upon the subject of "Efficiency Engineers" and substitute almost any title of another profession, and it would still read true. Every profession from time immemorial has had to bear up under its share of imitators or fakirs, but no real harm has ever come to any profession supported by principle and backed by actual accomplishments.

Many cases can be cited as to the effectiveness of efficiency and the wonderful constructive work of its successful engineers, as against each single case of failure from some new recruit or over-enthusiastic worker. Everyone is liable to err, no one man or profession is 100 per cent. perfect, but the large percentage of efficiency work is constructive, no

matter how poor it is, because business as a whole is so largely inefficient.

Occasionally one hears of a firm which is recovering after having been "done up" by a so-called "Efficiency Engineer," but invariably an inquiry will elicit the fact that no one ever gave the man the title of "Efficiency Engineer," outside of the firm who engaged him, and they are only suffering from an effort to get something for nothing. The firms accepting free service from companies with something to sell, without knowing the value of suggestions as applied to their problems, or the firms that have not yet learned to appreciate the value of competent counsel, and who engage a ten-dollar man to do a hundred-dollar job, are entitled to the same sympathy that is given the farm who buys the "gold brick" or the man who goes in on the "wire tappers" game.—Efficiency Magazine.

NEED FOR EFFICIENT EMPLOYEES.

MR. WILLIAM WILCOX, president of the Efficiency Society, in a recent talk at the West Side Y.M.C.A., New York, said that "the world is full of men who can do the commonplace thing. It is full of men who can put their hands to many things in an ordinary way, but if I want a man who can do some one thing a little better than someone else has done it, I have a hard time finding him. Men who are experts are the ones who get to the top. Some big places in this city are occupied (notice, I say occupied) by men who have got up through luck and pull, but the great majority of big places are filled (not occupied, but filled) by men who are where they are because they can do something better than anyone else."

Arthur Williams, chief inspector of the New York Edison Co., and president of the National Association of Corporation Schools, speaking on the same occasion, said, "the efficiency to be striven for was not that which means the speeding up of employees with more dollars for the employer as an immediate result, but that which tends to make a man or woman a better man or woman, a better developed social unit, producing normally and consuming normally."

STANDARDIZING THE SIZE OF CATALOGUES.

THERE is a movement on foot, says the Efficiency Magazine to have a more efficient system of issuing catalogues, and a campaign has been started by the Technical Publicity Association, whose membership comprises the advertising managers of many of the largest business houses in the United States, to induce firms to adopt standard catalogue sizes. Definite proposals have been prepared by the association and have been sent out to all the leading manufacturers, wholesalers and retailers.

The chief recommendation is that two sizes be adopted as the standards for all catalogues—6 by 9 inches and 8½ by 11 inches. If every house issuing a catalogue will have it made in one of these sizes, it can be filed for reference with other catalogues by anyone receiving it. With the present system of varying sizes, they take up valuable space unnecessarily. Many of the advertising and manufacturing firms have expressed their approval of the plan, and there seems to be every reason for its adoption. The chief of the catalogue department in one firm recently measured the catalogues of 700 houses, and found 147 different sizes among them, varying from pocket editions to immense books that would almost cover the top of a desk. The only possible objection to this standardization is that each manufacturer or wholesaler wants individuality in his catalogue, but this can be obtained by color and thickness as well as in size.

The advertising managers of the New York Telephone Co., the General Electric Co., the Western Electric Co., and the Texas Co., are among those who have indorsed the standardization movement.

VENTILATION OF OFFICES.

ONE of the most important things in an office is the question of ventilation, but it seldom receives much consideration. In this connection it might be well to adopt a plan which proved very successful in a school in Syracuse.

The lower sash is raised in four or five windows and the opening fitted with a wood frame covered with medium weight unbleached sheeting. The room in which the experiment was first tried had five 30 by 40-inch windows facing the east. Steam pipes extended across the room under the windows, and a hot air inlet 30 inches square was on the north side half way from the floor to the ceiling, with an exit opening of the same size near the floor.

In the morning before school opened, the room would be warmed by hot air driven by a fan. When school began, this hot air inlet would be closed and all the windows opened, so that there would be 50 square feet of open window space. The cold, fresh air would suffuse slowly into the room and would be met by the hot air rising from the steam pipes, so that no drafts were noticeable. The temperature of the room was maintained at 68 or 70 degrees as easily as before the screens were used, and the atmosphere very considerably purified.

CONCERNING EFFICIENCY.

THE study of methods is right and wise, but the thing to be done furnishes a better slogan than the method of doing it.

A slogan is a battle-cry, and it is not reasonable to stop the battle in order to fight over how we are going to conduct it. As a matter of fact, a great deal of present-day talk about efficiency is simply a diversion. Much alleged progress and up-to-dateness, and many exhortations to "get on to the job," are purely cant. Calls for men with "red blood in their veins" often indicate only a shortage of "gray matter in somebody's cranium." Many industrial movements fail to accomplish what they might, because of the inferior ideals set forth in their slogans, maxims, and literature.

One of the worst effects of the mere efficiency cry is the steely hardness it develops, the cold calculation of the leaders, and the discouragement of the weaker elements.

INCANDESCENT LAMPS FOR LARGE AREAS.

A HIGH candle-power incandescent lamp operating at an efficiency of approximately 0.6 watts per c.p., which is 33 per cent. higher than any efficiency yet attained in a commercial incandescent lamp for standard lighting circuits, has been brought out by the Westinghouse Lamp Co., Bloomfield, N.J. It is made in 750 and 1,000-watt sizes, the former giving approximately 1,100 c.p. and the latter 1,650 c.p. The filaments in the lamp consist of a closely coiled tungsten wire supported by anchors, and the light given is said to approach sunlight more closely than any other form of incandescent lamp.

On account of the great brilliancy of the filament, the manufacturer recommends that the lamps be used with some kind of diffusing reflector, which adapts them for indirect or semi-direct lighting of large areas in factories and mills. The lamps are intended for operation on direct or alternating current circuits of any frequency in commercial use at the present time, where the voltage is between 100 and 130.

Manufacturers' Census. — The last United States census of manufacturers is highly inefficient. For practical business purposes it has little to offer. A large house dealing with a certain class of manufacturers has therefore ordered a real and detailed census taken in the big industrial centres. With the data which is being secured, there will be possible a very active and wasteless campaign, which it is figured will in four months' time repay the cost of the census in postage saved alone.

Trade Gossip

Toronto, Ont.—A fire in the boathouse of the Marine Construction Co. at the foot of York street, did considerable damage. The building, which is owned by the C. P. R., was damaged to the extent of $1,500, while the loss to the contents will amount to $2,000.. The whole is fully covered by insurance.

Haileybury, Ont. — Improvements to the Haileybury water front costing several thousands of dollars will be made during the coming season and these improvements include the construction of a new wharf surrounding the market building and extending on each of the three sides for fifty feet, and a second wharf between Main and Marcella street.

Lakes Insurance.—A meeting of the Lake Underwriters' Association will be held shortly to fix the rate of insurance for the current season, which begins at midnight, April 15. In spite of the heavy losses occasioned by the disastrous storm on Lake Huron on November 9. last, when Canadian tonnage suffered a heavy blow with the sinking of four large freighters, together with a large loss of life, it is intimated by the underwriters that it is not likely the rates will be increased this year.

Navigation Companies Merging. — Negotiations are at present in progress looking toward the amalgamation of the Northern Navigation Co., and the White Pass and Yukon Route, which is largely owned by the Guggenheim interests. The Northern Navigation Co. has a fleet of thirty steamers, barges, etc., and has assets of approximately two million dollars. The boats are operated between Dawson and St. Michael, a distance of about 2,000 miles. The present overtures are being made by the White Pass and Yukon Route people largely on account of the rate war carried on in the north last year.

Twin Port Shipments.—According to figures compiled by Joseph Redden for the Port Arthur Board of Trade, the combined ports of Port Arthur and Fort William, with shipments of 203,328,129 bushels of grain in the navigation year of 1913, lead all ports on the continent of America in shipments of grain. Figures for the leading ports are as follows:—

Pt. Arthur-Ft. William	203,000,000
Buffalo	172,000,000
Duluth-Superior	115,000,000
Montreal	54,300,000
Chicago	54,000,000

Another fact brought into prominence by the same compilation of figures is the remarkable increase in the shipments from these ports in United States vessels. In four years the amount of grain taken out of Port Arthur and Fort William by United States vessels has increased by approximately five hundred per cent., while the increase in the amount taken out in Canadian vessels during the same period has been ninety per cent.

C.P.R. Marine.—An important change has been made in the management of the Marine Department of the C.P.R. in the eastern section. It has been announced that Capt. J. T. Walsh, who has been marine superintendent at St. John, N.B., during the winter season, has been made chief marine superintendent of all the Atlantic and Atlantic coast services of the C.P.R. with W. J. McGiffin as marine superintendent at St. John, and Capt. G. O. R. Elliott as marine superintendent at Halifax. Captain R. Archibald, formerly superintendent of the Bay of Fundy steamship service, relieves A. McGregor.

To Secure Canadian Trade.—The apparent indifference of British manufacturing firms towards Canadian import trade has prompted the Canadian Chamber of Commerce in London, England, to establish a British manufacturers' section. Nearly one hundred firms, among them some of the most prominent in the country, have joined the section and it has been decided to take collective action immediately for a campaign to capture a greater proportion of the import trade of the Dominion in manufactured goods. Another matter that will receive early attention will be the Canadian transportation problem, taking into consideration the freight position as it will exist consequent upon the working of the Panama Canal.

The Trent Valley Canal.—The contract for the second section of the western end of the Trent Valley Canal between Lake Simcoe and Georgian Bay has been awarded by the Government to the Inland Contracting Co. of Toronto. The amount of the contract is $712,258. The Severn River section was let some time ago to the York Construction Co. The contracts for the two remaining sections will be let in the near future, and it is expected that work will be in progress this summer, along the whole route from Lake Simcoe to Georgian Bay. The southern end of the canal, from Lake Simcoe to Trenton, will, it is expected, be practically completed by the end of this year. It will probably take two years yet to complete the western end of the canal.

Siemens Co., of Canada, Ltd., have received an order for 2 and 4-core submarine cable for service between Prince Edward Island and Nova Scotia, the total length in all being 28 miles. The 2-core cable is for telephonic purposes and the 4-core cable is for telephonic and telegraphic purposes.

Saskatoon After C.N.R. Shops.—Mayor Harrison and Alderman Potter and Anderson left Saskatoon a few days ago for Winnipeg to meet General Manager MacLeod, of the C.N.R., and bring all possible influence to bear to assist W. A. Silverwood, owner of the townsite of Factoria, to secure the location of the C.N.R. shops on his property. Factoria adjoins Saskatoon on the north, and is in the immediate vicinity of a half section of land owned by the railway company. It is commonly understood here that the C.N.R. have large plans in the making in connection with their western shops, and that it is only a matter of time until an announcement will be made that Saskatoon will be the chosen spot for the shops.

Steamship Offices Removal. — As the result of the merger of steamship companies under the name of the Canada Steamship Lines, Ltd., Port Arthur, once more comes in for a big loss, in the fact that the offices of the company are to be located at Fort William in the future. The offices of the Northern Navigation Co., which have been under the management of Mr. Brock Batten for so many years, and the offices of the Merchants Mutual Line which have been in charge of Mr. Walter W. Hall, will move to Fort William at once. The Canada Interlake Line, the Canadian Lake Line and the Inland Lines offices removed to the neighboring city some time ago. All these companies which form the merger will go into one big office at Fort William, and it is expected that a staff of 30 or more will be employed.

The York Mfg. Co., York, Pa., have recently made the following installations in Canada: R. Barron, Ltd., Toronto, Ont.; One 11-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete; O. W. Kaufman, Hagersville, Ont., one 4-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete; Ryerson Bros., Ltd., Brantford, Ont., one 4-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete; T. Long & Bros., Ltd., Collingwood, Ont., one 17-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete; J. Y. Parkhill & Co., Ltd., Kingston, Ont., one 5-ton vertical single-acting belt driven enclosed type refrigerating machine and high pressure side complete.

SAFETY ENGINEERING.

THE impending legislation in the Province of Ontario relative to workmen's compensation is giving those who direct and manage our industrial enterprises more or less concern because of the far-reaching nature of the proposals which are sought to be placed on the statute book. The fact, however, that seven thousand workmen in Canada come to their death or to serious injury every year in the pursuit of their daily avocations seems to justify more or less drastic law-making or an equivalent whereby a wholesale reduction of the above life waste will be secured. The latter or equivalent remedy only is here discussed.

The immediate necessity of preventing accidents due to any and every cause has brought our factory managers face to face with a new problem that, to many, has proved more or less perplexing. The outcome of this condition has been the appearance of many self-made and self-styled "safety engineers," although the well-rounded man conversant with all branches of this work is still a rarity. The work of the average safety engineer exists within the bounds of selecting, designing, constructing and applying of safety devices to buildings and machinery, and often in these spheres he does not enjoy the heartiest co-operation of the operatives; the latter being inclined, particularly at first, to characterize his work and presence as more or less of a nuisance. While the foregoing is a very necessary part of safety engineering, it embraces but a small percentage of the total number of accidents, besides, most modern machinery is so well guarded that the further addition of devices for the protection of the workman is more or less superfluous.

By far the more important branches of this science are, the rigid inspection of all machines and buildings, the maintenance of good order, cleanliness of factories, and the careful training of employees to adopt only safe methods of going about their work. We have seen the work supports and other attachments of grinding wheels allowed to be so worn that attempts to use them in the way they were originally intended would be more dangerous than any possible centrifugal force in the wheel itself. Again, the operating mechanism of punch and forming presses is often permitted to get so out of order as to make the action of these dangerous machines very uncertain. Such impediments to prompt and good work as holes in floors, unsafe staircases and tools out of place are also exceedingly common. More accidents are caused by tools and appliances that have outlived their usefulness and could be discarded with propriety, and by ropes, slings and methods that should be condemned, than by unguarded machines the danger of which is generally well-known to all workmen. The dangerous nature of such things as exposed set-screws in revolving shafts and unguarded chains and gears should be thoroughly apparent to any thinking man, not to mention the properly trained foreman.

In short, the largest part of safety engineering consists in maintaining the essentials to convenience and efficiency of production in our plants. If we could maintain the always necessary efficiency engineer at his proper standard, the need to requisition the services of a safety engineer would be reduced to a very satisfactory minimum.

Courage consists not in blindly overlooking danger, but in meeting it with the eyes open.—Richter.

The science of business is the science of rendering service—he profits most who serves best.

INDUSTRIAL NOTABILITIES--No. 28

FRANK ASHMORE SKELTON was born Jan. 19, 1870, at Sheffield, England. His father, Frederic Skelton, is managing director of The Canadian Shovel & Tool Co., Ltd., of Hamilton, Ont. The paternal ancestors came from the Lowlands of Scotland and North Britain, while those on the maternal side came from Ireland. An uncle, Sir Charles Skelton, J. P., lives in Sheffield, England.

Frank Ashmore Skelton was educated at private and public schools in his native city, and on his coming to the United States, he first became a blacksmith's helper at the Rhode Island Tool Works, Providence, R. I., and then a milling machine hand with Brown & Sharpe Co., of the same city.

In 1889, he was freight clerk at Kansas City, and in 1890 he joined the Audit office of the Vandalia R. R., being later, and until 1900, motive power and maintenance of way clerk with the same company. From 1901 till 1906 he was chief clerk and assistant auditor of the Pressed Steel Car Co., McKees Rocks, Pa., and of the Pressed Steel Car Co., Pittsburgh, Pa., respectively.

FRANK ASHMORE SKELTON.

In 1906, the subject of our sketch became secretary-treasurer of the Canada Car Co., Ltd., Montreal, and since 1909 he has been secretary-treasurer of the Canadian Car & Foundry Co., Ltd.

Mr. Skelton also holds the following offices:—Director and secretary-treasurer Canadian Steel Foundries Co., Ltd., Montreal; director and secretary-treasurer of the Pratt & Letchworth Co., Ltd., Brantford, Ont.; director of the Rhodes Curry Co., Ltd., Amherst, N.S.; director and vice-president Storage & Transfer Co., Ltd., Hamilton, Ont.

He is a member of the New York Club, of New York City; The Engineers Club of Montreal; The Manitou Fishing and Game Club of St. Agathe, Que.; The Montreal and Montreal Country Clubs; The Royal St. Lawrence Yacht, and St. George Snow Shoe Clubs, Montreal, and of the Montreal Amateur Athletic Association.

Mr. Skelton was married Oct. 14, 1896, to Frances Elizabeth Miller, of Brooklyn, N.Y., the union being blessed with three children, Hugh Miller Skelton; Neil Kennedy Skelton, and Bernice Skelton.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

THE BUSINESS OUTLOOK.

NOT all Canadian financiers are of the same mind regarding the outlook. A majority have, however, expressed for publication favorable opinions regarding the immediate future of the Dominion. One of our most prominent banking authorities says that:—

"It will take Canada more than a few months to recover from the set-back which she has received. Money has been poured into this country in the past few years and enterprises undertaken which ought never to have been begun at all. The total fixed charges on money borrowed by us is an immense sum, and we will have a hard time meeting this in the years to come.

"The railways have been vastly overdeveloped. Not three, but one good transcontinental line was what we needed. The sum already expended on the two latest roads is very great; and a great deal more money will yet have to be spent before the roads are completed. Then there is the question of business for these roads after they are finished. It will take a great deal of traffic to meet the charges on the money expended on the lines.

"I repeat that I believe that it will take not only one year, but many for Canada to recover from the rash spending of the last few years."

Montreal, Que., March 30, 1914.—While conditions are still decidedly dull there is some slight improvement over last week. With the opening of navigation again at hand, it is felt that Montreal's trade is about to show a more pronounced activity than it has done for the past month or two.

Orders have now been placed for the machine tool equipment recently listed in **Canadian Machinery** as being required by the Canadian Buffalo Forge Co., for their new plant at Berlin, Ont. Mussens, Ltd., have recently received an order for a 15-ton Brown Hoist locomotive crane to be delivered to the Sackville Freestone Co., Sackville, N.B., and have to-day booked an order for a Rahn-Larmon 24-inch extension bed gap lathe, the purchasers being Baldry, Yerburgh and Hutchison, who will use it in connection with their contract on the new Welland Canal.

The railways are buying very little machinery and other supplies as yet, but Sir Thomas Shaughnessy is said to look for a rapid increase in business shortly, Western stocks being very much depleted. This means that traffic earnings should show an improvement from now on, enabling the railways to spend more freely on new equipment.

In political circles at Ottawa the impression seems to be gaining ground that subject to certain stringent conditions, aid will be granted to the C.N.R. It is recognized that the country's interests demand that the road should be speedily completed and that the company should not be allowed to suspend construction or default in its financial obligations. Several of the provinces which are involved in guarantees with the C.N.R., particularly British Columbia, are urging a favorable consideration of the question by the Federal Government, and these influences will doubtless carry considerable weight. Less influential concerns than the C.N.R., however, who try to raise money just now are still being received by the banks in a cautious manner, and have to submit their propositions to the most minute scrutiny.

The Metal Market.

There is a fairly brisk trade being done in steel bars and plates, galvanized sheets, etc.; but pig iron remains very dull. In fact there is no life in any branch of the metal market. An improvement is looked for, however, with the opening of navigation.

Toronto, Ont., March 31, 1914.—The substantial improvement looked for this month can hardly be said to have materialized. In February a low water mark was reached, and it was then anticipated that by the end of March a much-improved condition would be manifest. We must, however, confess to being disappointed. The banks are accumulating money, but the confidence in business circles that we would expect from this does not appear to have resulted. It is difficult to obtain loans at a normal rate, with the result that large buyers and municipalities are holding off until the money market is easier.

The outlook in the steel trade is uncertain. A close survey of the situation leads us to believe that prices for second quarter delivery will not show any improvement over those obtaining during the quarter just closing. We are advised that the mills are now endeavoring to maintain prices, efforts to raise them higher not having been successful. Fewer large buildings requiring steel are being projected than is usual at this time of the year. This will have an effect on the demand for structural shapes. The agitation which is being made by the steel interests for assistance from the Government will have a tendency to create a spirit of uncertainty until a decision is arrived at. What form this assistance will take has not been decided, but if the principle of giving assistance is accepted, it will no doubt be in some form of bonus. Reports from the United States indicate that operations at the mills will have to be restricted unless the demand becomes heavier. The railroads are not placing such large orders for rails and equipment as was anticipated.

The pig iron market shows no improvement; prices remain the same, and the demand is light. We believe that an effort is being made by the makers to raise prices, but it is doubtful if they will be successful owing to the small volume of business being done.

Dealers in machine tools report fairly satisfactory conditions. The improvement reported last week has been maintained, but, although no large orders have been received, a number of smaller

ones have been booked. One firm of dealers reports having secured a nice order, including a Brown & Sharpe milling machine, an electric grinder, furnaces and a press. Another firm has sold a LeBlond grinder, a Hendey and a Rivett lathe. A number of nice inquiries have been received, but are being held at that, presumably for financial reasons.

The weakness in the metal market is still apparent, the volume of business is small, and no change of prices can be reported.

Winnipeg, Man., March 28, 1914.—The first steel steamboat built in Winnipeg has just been completed at the plant of the Doty Engine Works. It has been constructed for the Hudson's Bay Company, specially for navigation in shallow rivers. The vessel will be taken to pieces and reassembled at Fort McMurray.

Several firms in Winnipeg and throughout the West are making preparations for the erection of new plants. L'Air Liquide Society, 325 William Avenue, manufacturers of oxygen, are looking for a site, and will erect a plant during the spring. The Gilbert Hunt Manufacturing Co., Maple Creek, Sask., are preparing to erect a plant on Jasper Street for the manufacture of implements. Henry Birks & Sons, jewelers and silversmiths, who are building a new plant, are in the market for machinery.

Inquiries for machine tools coming in are healthy, but manufacturers seem to be deferring their buying until conditions have improved. If this year's crop be good, it is believed that business will speedily return to normal. Most local dealers are disposing of small lots of tools to garages and small machine shops, but the railways are not buying, except what they are absolutely in need of. The transmission, equipment and general repair business is in excellent shape, the demand for belts and pulleys being quite large. There is a fair demand for steam and hydraulic plant accessories.

The Stuart Machinery Co. secured the order for two of the machines required by the Riverside Lumber Co., Calgary, who are erecting a new barrel plant, the remainder of the order going to the Berlin Machinery Co., Hamilton. A large amount of woodworking machinery is being bought throughout Alberta. Several new mills are going up in British Columbia, and there should be a call for machinery from that quarter before long.

Good progress is being made on the Manitoba Rolling Mills at Selkirk, Man., which is a new plant being erected near Winnipeg. The boiler house is practically completed, and work should soon start. The Stuart Machinery Co. recently secured the Manitoba, Saskatchewan and Alberta agency of the American Woodworking Machinery Co., Rochester, N.Y.

GEORGIAN BAY CANAL COMMISSION WORK.

THE character of the inquiry respecting the Georgian Bay Canal is set forth in an Order-in-Council made public on March 28, following a conference between Mr. Sanford Evans, of Winnipeg, and Col. F. H. Meighen, of Montreal, with Hon. Robert Rogers, Commissioner Edouard Gohier, of Montreal, is in Europe, but is returning shortly, when regular meetings will be held, and the inquiry proceeded with. Mr. J. D. Hepburn, who for many years has been connected with lake transportation, is secretary of the commission, and will start at once to collect preliminary data. The inquiry will cover the following points:

Scope of the Inquiry.

(1)—A study of the transportation problem in relation to the proposed waterway.

(2)—The advantages of a large waterway from the lakes to the seaboard open to the largest type of lake carriers; the feasibility of these carriers navigating such waterway, and the influence on the rate regulation of transport.

(3)—Competition of the waterway with the railways; effect on railways by creating new industries on account of cheap transport of low-grade freight that cannot be handled by rail.

(4)—The probable volume of traffic available on account of the natural advantages of such waterway.

(5)—Causes for diversion of Canadian traffic to United States ports.

(6)—Lake rates and a general comparison with railway rates and relative volumes of traffic.

(7)—The position of the North-West, and how the situation at the head of the lakes would be ameliorated.

(8)—The position of the existing and projected gulf lines via Galveston; what their influence would be with regard to the diversion of traffic from the lakes and St. Lawrence route; the effect upon the movement of the traffic by the opening of the Hudson Bay and Pacific and Panama routes.

(9)—Conditions on the Atlantic seaboard as to handling traffic and as to ocean and insurance rates.

(10)—Interprovincial trade and facilitation of exchange of eastern and western products owing to lower rates.

(11)—The canal as a factor in developing the iron and pulp industries and other resources.

(12)—The development of water powers along the route and the tendency to manufacture at the base of supply.

(13)—New territory which may be opened in the North-West and cost of transportation of wheat to the head of the lakes.

(14)—Storage at lake and seaboard terminals.

(15)—Markets, statistics, history of canals and their development.

(16)—Generally speaking, the commercial feasibility of the proposed waterway.

N.Y.C. REDUCES OPERATING FORCE.

DISMISSAL of 25,000 men by the N.Y. Central Railroad since December 1, said A. T. Hardin, vice-president of that road on March 28, is only a barometer of the company's business. "The reduction of forces was not arbitrary," he added. "It came about gradually as traffic, mainly freight declined, and while I don't want to be a pessimist, I cannot see any immediate prospect that business will pick up and these men come back to work." Mr. Hardin said this condition affected most of the Eastern railroads.

Of the 25,000 men dismissed by the New York Central, about 15,000 were laid off on lines each of Buffalo, and 10,000 west of Buffalo. Although the reduction affected all branches of the service, the employees of the construction, the operating, and the maintenance-of-way departments suffered most.

"Compared with 1913," said Mr. Hardin, "the business of this year on the New York Central suffered a reduction of from eight to ten per cent. The reduction of the working forces has been on the same ratio."

Kayser, Ellison & Co., of Sheffield, England, have opened a Canadian office at 126 Craig street, W., Montreal, where a full stock of high grade tool steel will be carried in addition to wire and drill rods. Mr. Ralph B. Norton is in charge.

The Turbine Equipment Co., Toronto, report recent sales as follows:—Two De Laval multi-stage motor driven pumps with capacity of 700 gallons per minute against 216 ft. head, and two De Laval single stage motor driven pumps with capacity of 600 gallons per minute against 112 ft. head., for the Canadian Copper Co., Whitson Lake water supply; one De Laval centrifugal pump with capacity of 400 gallons per minute against 70 ft. total head for J. R. Booth, Ottawa. This pump will have a motor mounted on one side and a De Laval steam turbine on the other.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

F. W. Moore has been appointed manager of the Garlock Packing Co., Montreal branch.

Basil D. Hall was elected president of the Peterborough Board of Trade at the annual meeting, held recently.

W. A. Owen has been appointed city engineer of Nanaimo, B.C. The new official has been a resident of Nanaimo for some time.

R. B. Angus, ex-president of the Bank of Montreal and a director of the C.P.R., is expected home from his world tour about the first of May.

H. D. Johnson late with the Canadian British Insulated Co., Ltd., has joined the staff of the Eugene F. Phillips Electrical Works, Ltd., Montreal, as assistant contracting manager.

F. M. Osborne, of Samuel Osborne & Co., Ltd., Clyde Steel Works, Sheffield, Eng., has just completed a trip through Eastern Canada. Heap & Partners, Montreal, are the Canadian representatives of Samuel Osborne & Co.

J. M. Mussen, Canadian Trade Commissioner in Leeds, Eng., who is returning to the Dominion, received a presentation of plate from his Leeds friends, among whom were the American Consul.

Ben. W. Folger, of Kingston, Ont., died in Toronto on March 26, aged 76. Mr. Folger was one of the founders of the Thousand Islands Steamboat Company, and later was instrumental in establishing the Kingston, Portsmouth, Cataraqui Electric Company.

F. A. Gaby, chief engineer of the Hydro-Electric Commission, addressing a meeting of the members of the Canadian Institute, recently in Toronto, described the work of the Commission at length and told of the remarkable expansion of the power system in Ontario. He said that millions of dollars were invested in hydro power by Ontario municipalities, and every dollar of it was bringing in full returns. Mr. Gaby quoted statistics respecting the tremendous development of the scheme during the past three years.

William Millar recently arrived in Montreal, to take up the position of general manager with Geo. Anderson & Co., of Canada, Ltd., who have moved into more commodious offices in the Quebec Bank Building, Montreal. Mr. Millar has been with the parent company at Carnoustie, Scotland, for 14 years, latterly occupying the position of gas engine expert. He is much interested in this branch of engineering, and hopes to see the suction gas engine much more widely used in Canada than it is at present. Geo. Anderson & Co., in addition to building gas engines, are widely known as makers of stone cutting machinery and cranes of all types.

WHO'S WHO.

EARL F. HETHERINGTON,
Publicity Manager, The Goldie & McCulloch Co., Galt, Ont.

C. M. A. and Workmen's Compensation.—To emphasize their protest against certain provisions of the Workmen's Compensation Bill now before the Legislature, an emergency meeting of the Canadian Manufacturers' Association has been called for Thursday and Friday of this week in the King Edward Hotel, Toronto. The object of the meeting is to discuss the proposed Bill in every aspect, and consider plans for placing the objections which the manufacturers take to its principles before the Government. Already the Bill is going through the committee stage, and whatever changes the manufacturers desire, if they are to be granted, must be determined upon quickly.

Trade With Portugal.—Mr. Frederick Nicholl, Consul for Portugal, asks publication of the following letter received by him: "Being desirous of enlarging our commercial business, especially the foreign one, the directors of the Commercial Association, Lisbon, have approved of the installation of a room for catalogues of the most important commercial houses in the world, in order to have their business men acquainted with prices of all articles in the world's market, and for the above reason we ask you to be kind enough to invite by the most practical means the commercial houses of your district that export their products to present their catalogues to the association." Catalogues should be addressed to the Associacao Commercial de Lisboa, Lisbon, Portugal.

Canadian Pig Iron Production.—The production of pig iron in Canada in 1913, including ferro-silicon, ferro-titanium, and ferro-phosphorus, amounted to 1,015,118 gross tons, against 912,878 tons in 1912, an increase of 102,240 tons, or nearly 11.2 per cent. The production in 1913 was much the largest in the history of the Dominion. For the first time the output exceeded 1,000,000 tons. Of the total 986,848 tons were made with coke and 28,270 tons with charcoal, coke and electricity, etc., against 886,506 tons made with coke and 26,372 tons made with charcoal, coke and electricity, etc., in 1912.

Expects Improvement.—In the annual report of Steel & Radiation, Ltd., the general manager, R. J. Cluff, states that, judging from the amount of unfilled orders on file with the company, and the numerous building permits which the sales department has listed, it is believed that with the easing off of money, building operations in Toronto will commence early this spring. He anticipates a considerable increase in sales. Mr. Cluff points out that Steel & Radiation, Ltd., had an increase of 25 per cent. in sales last year, despite the fact that the universal money stringency checked building operations. In November and December, 1913, business dropped materially, falling below 1912.

Canadian Allis-Chalmers, Ltd., Toronto, have been appointed sole agents in Canada for the Lidgerwood Manufacturing Co., New York. This company manufacture a complete line of hoisting engines, cableways, derricks, rapid ballast unloaders, etc.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Kerrobert, Sask.—The Grand View Iron Works, of Vancouver, are negotiating to establish a plant here.

Kingsville, Ont.—The Dominion Stove Co. will build a factory. J. C. Pennington, architect, Windsor, is preparing plans.

Bridgeburg, Ont. — It is announced that an automobile factory will be built at Fort Erie. The total cost is estimated at $200,000. O. T. Johnston, of Toronto, is interested.

Canora, Sask.—A. D. Hilts, of Glenwood, Minn., will probably establish a foundry and machine shop here. It is estimated that the initial expenditure will be $10,000.

Kerrobert, Sask.—It is stated that the Grand View Iron Works Co., of Vancouver, will build a plant here. The Board of Trade have been approached with regard to a suitable site.

Ingersoll, Ont.—The Wilson & Short Company of Detroit, automobile manufacturers, have taken over an existing factory here, and will install machinery, some of which will be brought from Detroit. New machinery will be required in addition.

Quebec, Que.—A complete set of new plans and specifications have been prepared by Engineer E. A. Evans, of Quebec, and were submitted to the Lake Megantic Council at its last meeting, covering the construction of the hydro-electric plant on the Chaudiere River.

Collingwood, Ont.—Subject to the scrutiny now pending showing that the by-law has the requisite number of votes, the council of the town of Collingwood may proceed to pass the by-law guaranteeing to the extent of $100,000 an issue of bonds by the Imperial Steel and Wire Co., of Collingwood. The opposition to the previous by-law, which passed, has been overcome.

St. Lawrence Welding Co., Montreal, are vacating their present premises on Roy Lane on May 1. They have secured much larger and more convenient quarters at 138-140 Inspector street. They are also operating a branch in St. Catharines, Ont., where every department of autogenous welding, both shop and portable work, is undertaken. The company expect to open a large number of branches in Canada in the near future.

Galt, Ont.—It is announced that the Perfect Machinery Co. has been organized, with J. Rumble, of Blenheim, president; Wesley Clark, of Guelph, vice-president; and S. L. Clark, of Galt, secretary-treasurer. The concern will be in operation by May 1, and has sufficient orders to keep the plant busy for a year. The company will manufacture grinders, polishers and a line of small drills and lathes.

Winnipeg, Man.—Engineers of the Greater Winnipeg water district are working on plans for the tunnel that will be constructed under the Red River, and through which will be brought the water from Shoal Lake on its way from the eastern part of the aqueduct to the city reservoirs at McPhillips Street and Logan Avenue. It will connect the five-foot steel pipe to the east and the four-foot cast-iron pipe on the city side, and will cost $130,000.

The American Road Machine Co., of Canada, Ltd., are in the market for the following equipment for their new factory at Goderich, Ont.:

- **Large punch and shear.**
- **Turret lathe.**
- **Bulldozer.**
- **Electric Motors.**
- **Heating and Ventilating plant.**

Portage la Prairie, Man.—Mr. Cooper, representing the North American Machine Co., was a visitor here recently looking over the ground with a view to securing a desirable site for the erection of a building to be used by the company as a distributing plant and Western Canada headquarters. While nothing definite can be learned as to whether it has been decided to locate, it is known that he secured a thirty days' option on two sites. The company, which deals in all kinds of farm machinery, has a number of offices in the West, but as yet no distributing point.

Nelson, B.C.—Within 90 days, if everything proceeds smoothly, the new unit at the plant of the West Kootenay Power and Light Company at Bonnington Falls will be completed. It will be of 10,000 horse-power and the largest in British Columbia, and will increase the capacity of the company's two Bonnington plants to 30,000 horse-power. The 10,000-h.p. turbine, supplied by the Allis-Chalmers Company of Milwaukee, is on the ground. The 10,000-horse-power generator and new transformers have been delivered, while the switchboard apparatus is expected to arrive in about one month.

Gibson, N.B. — A company composed of Mr. J. J. McCaffrey, of Fredericton; H. J. McGrath, formerly inspector of concrete on the I.C.R., and T. C. Burpee, formerly engineer of maintenance and ways on the I.C.R., have purchased the I.C.R. foundry at Gibson, and will there manufacture concrete in all forms, both for industrial and ornamental purposes. The new company has a capitalization of $25,000, and Mr. McGrath will become manager, and Mr. Burpee, mechanical superintendent. The field for a business of this nature in the Maritime Provinces seems very bright as the concrete business has not yet developed in these sections in comparison with the development which has taken place in the upper Canadian Provinces.

Electrical

Canora, Sask.—A by-law authorizing extensions to the electric light plant has been passed.

St. Thomas, Ont.—At a meeting of the Hydro Commission on last Saturday afternoon it was decided to purchase a rotary converter at an approximate cost of $3,000 rather than to renew the storage battery at a cost of $6,000.

Owen Sound, Ont.—Engineer Gaby, of the Hydro-Electric Commission, assured Chairman John Legatt, of the Owen Sound electric light and power committee, that hydro power from Eugenia Falls would be available in Owen Sound by next January or February at the latest.

Woodbridge, Ont.—The municipality of Woodbridge will vote on the Hydro-Electric by-law on Saturday, April 11. This has been decided on by the Reeve and council of that village. Should the people decide in its favor, debentures

amounting to $6,000 will be sold to provide the necessary plant and machinery.

The Stanworth Power Co., Ltd., of Toronto, has been Federally incorporated with a capital stock of $250,000. The incorporators include: W. J. Simpson, Stewart W. Hall, Robert E. W. Duke, Alfred Wales and H. G. Hammond. The company is empowered to do a general power development and power distribution business.

Hamilton, Ont.—The Hydro Commission opened tenders last Saturday for the new electric standards for street lighting submitted by the Union Metal Mfg. Co., Galt; the Ornamental Lighting Co., Hamilton, and the Northern Electric Co., Toronto. The Canadian Westinghouse Co. was awarded the contract for a disconnecting switch. The price was $115.

Vancouver, B.C.—The Western Canada Power Co. is arranging for a considerable amount of work in connection with its generating plant at Stave Falls this year as well as on its distribution service, and in July a 13,000-h.p. turbine from Switzerland is to be delivered. Mr. Hayward, the general manager, states that in addition to this turbine there are coming a 9,000-h.p. generator, five 3,000 k.w. transformers from the Canadian General Electric Co., and a large outfit of switchboards from the Canadian Westinghouse Co. These are all for use in connection with the third unit at Stave Falls, the building for which will be completed this summer.

Municipal

Dundas, Ont.—The town council may install a sewage disposal system.

Strathroy, Ont.—The Board of Trade will make an effort to induce new industries to locate here.

Hamilton, Ont.—The city is going ahead with a scheme to develop an industrial area in the west end.

Wilkie, Sask.—The town will spend $7,000 on the waterworks system. Debentures will be issued to cover the cost.

Hamilton, Ont.—Work will begin on April 15 on the new sewage disposal plant. The cost is estimated at $200,000.

Battleford, Sask.—The City Council have decided to complete the waterworks system which will entail an expenditure of $25,000.

Edmonton, Alta. — The Industrial Bureau are raising funds for various purposes, one being the development of the Viking gas field.

Regina, Sask.—The city council have decided to appoint an industrial commissioner instead of making a grant to the Board of Trade.

Victoria, B.C. — The city is in the market for an 8-ton steam road roller. Tenders received by W. Galt, purchasing agent up till April 27.

Sarnia, Ont.—The Board of Trade has received subscriptions amounting to $4,000 towards the $10,000 required for financing a publicity campaign.

Stratford, Ont.—The ratepayers will probably be called upon in the near future to vote upon a by-law to raise funds for a new street lighting system.

Redcliffe, Alta.—The Redcliffe Council has authorized the extension of the water service to supply several new factories and outlying districts. The cost will aggregate seven thousand dollars.

Port Credit, Ont.—The village council have desided to install a waterworks system. A by-law will be submitted to the ratepayers to authorize an issue of debentures to cover the cost of the work.

New Liskeard, Ont. — Following the recommendations to council some time ago by the fire chief regarding the department's equipment, an order has been sent in for additional fire-fighting apparatus.

Victoria, B.C.—The Industrial Committee will recommend that the sum of $4,000 be placed in the estimates as the year's salary of an industrial commissioner, the purpose being to advertise in the principal papers of Canada.

Victoria, B.C.—Sealed tenders will be received up to 4 p.m., Thursday, April 30th, 1914, for a semi-portable asphalt plant for the Corporation of the City of Victoria, B.C. Specifications may be secured from W. Galt, city purchasing agent.

Fredericton, N.B.—The city council at a meeting held on March 26 passed a resolution to secure legislation to issue debentures for the purpose of buying a motor-driven combination chemical engine, to cost $7,400, for the Fredericton fire department.

Dawson City, Y.T.—This city is preparing to install city-owned telephones, water, light and power plants. The civic league, composed of all political parties, is petitioning the Yukon Council now in session, for the necessary authority for the city to sell bonds to the extent of $200,000.

Port Hope.—At an enthusiastic meeting of the Board of Trade, held in the Town Hall here, recently, the following officers were elected: President, T. B. Chalk; vice-president, H. Fulford; secretary, Captain A. H. C. Long; treasurer, Edward Brown. The board is employing a commissioner in United States to secure factories.

Whitby, Ont.—At a special meeting of the town council, which was held last Friday, it was decided to go on with the establishment of a sewer system for the county town. The engineer, T. Aird Murray, was instructed to complete his plans and specifications preparatory to advertising tenders for sewers and disposal works estimated to cost about $100,000.

Ottawa, Ont.—The campaign on the question of the source of Ottawa's water supply terminated on March 30, when the ratepayers by a majority of 1,308 declared their preference for the Ottawa River water filtration mechanically as against the scheme of Sir Alexander Binnie to bring water from Thirty-One Lake in the Gatineau district. Over thirteen thousand votes were cast, 7,544 for the river and 6,236 for the Gatineau Lake scheme.

General Industrial

Winnipeg, Man.—A permit has been issued to a company, who will build a knitting factory.

Brussels, Ont.—C. Pope & Son, have leased a factory and will require machinery.

Forest, Ont. — The Thedford Fruit Growers' Association will build a fruit packing plant at Thedford.

Port Elgin, Ont.—W. A. Mitchell, fruit grower, has purchased a good-sized canning plant and moved it to this town.

Quebec, Que.—It is announced that the J. B. Blouin Co., manufacturers of boots and shoes, will move their plant to Sherbrooke.

Waterloo, Ont.—Permission has been given to advance a loan of $10,000 to the Quality Mattress Co. to assist in establishing a factory here.

Port Stanley, Ont.—The Port Stanley Mfg. Co., recently incorporated will take over the broom manufacturing business formerly operated by L. E. Lee and A. C. Wiley. The company is capitalized at $40.000.

Galt, Ont.—J. C. Dietrich, president of Shurly-Dietrich Co., states that his company is not seeking financial assistance from the town. The loss sustained recently at the fire will not exceed $100,000 over and above the insurance.

The Pas, Man.—A company, composed of local men, have applied for a charter to enable them to proceed to manufac-

ture and sell brick and sewer tile from clay deposits adjacent to this town. Mr. G. M. Brown is president of the company.

Moose Jaw, Sask.—It is reported that a company, with a capital of $200,000, will build a flax mill here.

Oakville, Ont.—The Glassco Fruit Preserving Co. will make an extension to their plant. The town will give them assistance.

Young, Sask.—A steam laundry will probably be established here. Mr. D. A. Berneche is president of the company behind the scheme.

Hamilton, Ont.—The National Natural Gas Co. are proceeding with the construction of their plant, and will lay several miles of pipe this year.

Melfort, Sask.—Olf M. Olson, of Volga, S.D., spent several days here during the past week looking over the situation, with a view to establishing a 250 or 300-barrel flour mill.

London, Ont. — Henry Botteri, of Schenectady, N.Y., who was awarded the contract for the fireworks display at the Western Fair this year, is planning the establishment of a large fireworks factory here.

Port Colborne, Ont.—Niagara Grain and Seed Co., Ltd., have asked for a fixed assessment of $10,000. The site selected for this compnay's building is west of the Maple Leaf Mills. The proposed building and equipment is to cost $200,000.

Winnipeg, Man.—The International Milling Co., with mills at Moose Jaw, Sask., and Calgary, Alta., as well as a number of points in the Northern States, is considering adding to its present plants in Canada.

London, Ont.—Ten thousand dollars' damage was done by fire to the Dominion Abattoir on March 25. The fire was confined to the stock house, which was almost completely gutted. The origin of the fire is unknown.

Galt, Ont.—The Shurly-Dietrich Co. is rebuilding the portion of their extensive plant recently destroyed by fire, with a loss of $200,000. The Board of Trade is negotiating with the company with a view to re-establishing larger works, conditional on due assistance from the town.

Nelson, B.C.—A local syndicate has arranged to build a plant with a capacity of a ton a day to demonstrate the possibilities of platinum mining in the Kootenay. A London metallurgist, who has been working on the experiments, is supervising the erection of the plant. R. M. McQuarrie is interested.

Regina, Sask.—Duncan B. Lea, of Chicago, representing a company, which will be known as the United Oil Co. of Western Canada, has been here looking over a site on which to erect a factory. The company will manufacture linseed oil and meal, but have not up to the present decided where to locate.

New Glasgow, N.S.—Work will be resumed at once by the Standard Clay Products Co., part of whose plant was recently destroyed by fire. The new factory, which was just completed, escaped the fire, and the operations of the company were not crippled to any extent. The plant destroyed will be rebuilt at once.

Wallaceburg, Ont.—It is stated that a large tract of land near the Dominion Sugar Co. plant has been secured by the Parke-Davis Medicine Co. and the Walkers, of Walkerville, and that a big factory will be built there at once for the manufacture of glass bottles.

Cambellford, Ont.—The Northumberland Paper and Electric Co., Ltd., have disposed of their interest in the pulp mill to the Seymour Power Co., who will operate it under the name of the Northumberland Pulp Co. The head office of this latter concern will be in Toronto.

Lindsay, Ont.—The Horn Brothers Woolen Co., Ltd., by-law carried on March 24 by a majority of 502. A very large vote was polled. Horn Brothers will be given a fixed assessment and will be granted $7,500. They will build a siding, erect new buildings and equip new plant.

Melfort, Sask.—G. A. McEwen, secretary for the newly-organized Canada West Grain Co., states that the first block of $40,000 of stock offered for public subscription has already been taken up. The company will shortly start operations on new elevators at Naisberry and St. Brieux, and possibly at Beatty.

St. John, N.B.—Bigelow & Hood, of Truro, N.S., manufacturers of aerated waters, who for some time past have been conducting a branch store on Main Street, have decided to open bottling works in this city. They intend manufacturing malto peptinized porter and several lines of soft drinks. Mr. J. P. Foley will manage the new factory, which will be located in the north end.

Walkerville, Ont.—A new company, which will manufacture metal polish, auto body polish, soaps, auto oils, etc., has just started business in the old malleable iron building, Walker Road. It will be known as the Coate-Green Co., and is composed of Messrs. J. R. Coate, D. Green, J. F. Petch and J. Coatsworth. For the present, two floors of the building, each about 100 x 40 feet in dimensions, will be occupied.

Sarnia, Ont.—Construction work on all parts of the Imperial Oil Co. refinery is being carried forward as fast as possible. The new acid house in the rear of the Pere Marquette round house has been completed, and the boilermakers are now constructing a large number of tanks, which will be used to store the acid. The operations on the new plant, south of Clifford Street, have been proceeding steadily during the winter, and already the condensers for the new stills have been placed in position. Several large steel tanks are also under construction, while the underground storage tanks have been completed. The company is also putting down several large water mains, which will provide fire protection for the new plant.

Wood-Working

Wiarton, Ont.—The by-law granting a loan of $25,000 to the Canada Casket Company will be voted on this month.

Waterloo, Ont.—The Globe Furniture Co. has decided to build a large addition to its plant on Erb Street, at a cost of about $125,000.

Sarnia, Ont.—The new planing mill, which is to be constructed for the Lawrence Lumber Co., has been started, and the work will be pushed forward as fast as possible. The manager of the company was in Toronto few days ago purchasing machinery.

Edmonton, Alta.—Michigan lumbermen were here for the purpose of building at Willow River, what they claim will be the largest sawmill in the world. They say it will cut 100,000 feet daily. There is 300,000,000 feet of merchantable timber in the vicinity.

Stratford, Ont.—The Ruston Company recently decided to enlarge their planing mill on Milton Street. The work is now being proceeded with, Pounder Bros. being the contractors. The addition will be 49 feet by 87 feet, and will be situated to the west of the present mill, on property recently acquired by the company. It is to be of brick construction, two storeys high.

Orillia, Ont.—A by-law to loan J. R. Eaton & Sons, Limited, $50,000 for twenty years was carried on March 30, by a good majority. The vote stood: For the by-law, 720; against, 223. The by-law also provides for a gift of a ten-acre site and a ten-year fixed assessment. Eaton & Sons undertake to build and equip a sash and door factory and planing mill, with an appraised value of $100,000, on which the town is to hold a first mortgage as security for the loan.

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

Miscellaneous

The Industrial Engineering & Machinery Co., have been awarded a contract by the Quebec Brick Co., for a large rock crushing plant to be erected at Beauport, Que.

The Herbert Morris Crane and Hoist Co., Toronto, have just closed a contract with the Canadian Westinghouse Co. for a complete runway system in their new foundry at Hamilton, Ont.

Burlington Steel Company, Ltd., is the new name of the Canada Steel Company, Ltd., Hamilton, Ont. The change has been made because of the similarity of names of several Hamilton companies and the confusion resulting therefrom.

The St. Lawrence Pulp and Paper Co., Gaspe, Que., have awarded a contract to the Canadian General Electric Co. for the supply of two 1,000 k.w. turbo-generators. The structural steel department of the Canadian Allis-Chalmers, Ltd., will also supply the steel necessary in the erection of the pulp and generating buildings at present under way.

Fredericton, N.B., the progressive capital city of the Province of New Brunswick, is one of the first cities in the Maritime Provinces to come forward with the spring announcement that it has secured a new industry and it is also understood that other additions to the business life of this thriving city will be made in the course of several months.

Catalogues

Welding and Cutting Plants are described in a catalogue issued by the Waterhouse Welding Company, Boston, Mass. The various equipments made by the company are illustrated, together with a description and list of parts for each. A list of supplies, with prices, is given at the end of the catalogue.

Production of Explosives in the United States is the title of technical paper 69 issued by the Bureau of Mines, Department of the Interior, Washington, D.C. The principal features to be noted in this bulletin are four tables giving the amounts of various explosives used and the purpose, all the data being classified under the different States.

Permissible Explosives is the subject of technical paper 71, published by the Bureau of Mines, Department of the Interior, Washington, D.C. The bulletin contains two tables—No. 1 giving the various brands of explosives and their manufacturers, while No. 2 gives the rate of detonation for all these brands. The tests were made prior to January 1, 1914.

"**Drill Chips**" is an attractive sixteen-page booklet prepared by the Cleveland Twist Drill Co. for its patrons and others. It is not intended to be an exposition of the operation and use of twist drills, but contains a fund of logic connected with widely varying subjects which is calculated to start the wheels of thought in men where they have been long since stopped. A very unobtrusive, but insistent advertising plan is effectively clothed with a collection of humorous anecdotes that will persuade even the busiest man to read to the end. The booklet will serve as an attractive list of the more important of the firm's drill products.

"**Ottawa, Ont.,**" is the title of a handsome brochure issued by the Grand Trunk Railway System, describing the principal features and places of interest in and around that city. The illustrations are colored, and altogether highly attractive. They include several interior views of the Chateau Laurier and pleasure resorts in the district. A brief

description is given of the public buildings and other places of interest.

Jaw Crushers, manufactured by Canadian Allis-Chalmers, Ltd., are the subject of Bulletin No. 1,451 issued by the company. These crushers are of the "Blake" and "Dodge" types, and are fully illustrated to show their principal features by means of sectional drawings. One crusher described is constructed of comparatively light sections to facilitate transportation. The bulletin also contains diagrams and tables, giving clearance dimensions.

Patent Universal Angle Bending Machines are dealt with in a leaflet issued by Neville's, Ltd., Liverpool, Eng. The principal feature to be noted in this leaflet is the number of diagrams showing the respective positions of the jaws on the machine and the work to be treated, indicating the wide scope of its application. A table is included giving the dimensions for various sections and bars that can be handled by each size of machine.

The Canadian Allis-Chalmers, Ltd., Toronto, have issued Bulletin No. 1,807 describing their iron ore washing plants. The bulletin contains a great deal of interesting information on low-grade iron ores and methods of treatment to make them commercially suitable for smelting. The process is explained with the assistance of a number of illustrations of an installation at the plant of the Oliver Iron Mining Co., together with a description of the equipment.

"**Manganesite**" is the title of a booklet which we have received from John Hudson & Co.'s Successors, London, England. This booklet deals with "Manganesite" compound for pipe joints, enumerating the claims made for this material when used with pipes carrying steam, acids, oil, etc. A list of places where it can be used is given, with instructions for application. The booklet also contains a number of testimonials. Copies may be obtained by interested readers.

The Electric Tachometer Co., Philadelphia, Pa., have recently published Bulletins Nos. 200 and 201, descriptive of the "Locke Electric Drill" which they manufacture. Bulletin No. 200 gives a description of the drill with an illustration and a detailed list of work that it will accomplish, while Bulletin No. 201 gives a partial list of records of drilling, including location and description of work and time taken to do same. Copies of these bulletins may be obtained from the Canadian agents, R. E. T. Pringle Co., Toronto.

Oil Filtration is the title of a new catalogue which we have received from S. F. Bowser & Co., Fort Wayne, Ind. This is a very attractive publication, the reading matter being set in large type and the illustrations being colored and arranged so as to give a clear idea of the methods of operation of the "Bowser" oil filtering and circulating systems. The principal features of the "Bowser" systems are described fully, and some interesting charts are included. The latter pages are devoted to engine oiling systems, and include a diagram and several illustrations. Copies of this catalogue may be obtained from the Canadian branch, S. F. Bowser & Co., Toronto.

Hydraulic Presses are dealt with in Catalogue No. 40, which we have received from the Hydraulic Press Manufacturing Co., Mount Gilead, O. This is a very fine production covering a full line of hydraulic presses for all purposes. The illustrations are exceptionally good, and show clearly the general design of each press. They also include photographs of the members of the organization and interior views of the offices and workshops. The descriptive matter states for what purpose each press has been designed, and is accompanied by tables giving the capacity and principal dimensions of each size illustrated. The concluding pages are devoted to various types of hydraulic pumps and accumulators.

The Graton & Knight Manufacturing Co., Worcester, Mass, have sent us a copy of Catalogue No. 5, which deals with the various brands of leather belting they manufacture. Particulars are given of each belting brand and of other leather products, together with suggestions regarding the work for which they are best suited. Some useful information is given on belt drives, care of belting and belt lacings, and also a number of rules and tables on horse-power, belt speeds, etc. The illustrations include interior views of the factory showing belting in process of manufacture, and also views of the product. The catalogue is well got up, and presents an attractive appearance.

The Pratt & Whitney Co., Ltd., Dundas, Ont., have sent us Catalogue No. 7, devoted exclusively to a description of the product of the small tool department. This includes a full line of taps, dies, milling cutters, reamers, drills, etc., a section of the catalogue being devoted to each. The illustrations are very clear, and in the reading matter a description is given of each tool, accompanied by tables, showing the principal dimensions and prices. The catalogue contains in the last few pages several useful tables on screw threads, tap drills, wire gauges, decimal equivalents, etc. The catalogue is an attractive production, and is fully indexed. Copies may be obtained by interested readers from the Canadian Fairbanks-Morse Co., Ltd., Toronto, who are the selling agents in Canada.

Book Reviews

The Trent Watershed Survey is the title of a book published by the Commission of Conservation appointed by the Dominion Government. The book consists of a report prepared for the commission by B. E. Fernow, C. D. Howe and J. H. White, who surveyed the Trent (Ontario) watershed for the purpost of obtaining information as a guide in the preservation and development of forest areas, together with the examination of water powers, in connection with the Trent Valley Canal. A history of the region is given, and also recommendations for its development principally with regard to the lumbering industry. In a section of the book are included a number of forest survey tables giving a classification of lands in the various townships. Part 3 is devoted to a brief description of conditions obtaining in each individual township, and also to a general review of farming conditions in the region. A number of appendices are included, covering such matters as lumbering, physical features and geology. The report contains a number of excellent photographs and maps.

"**Mortar-Making Qualities of Illinois Sands,**" by C. C. Wiley of the Department of Civil Engineering of the University of Illinois, has just been issued as Bulletin No. 70, by the Engineerinng Experiment Station of that University. Althongh sand is one of the most common materials in engineering construction, its characteristics are perhaps generally the least well known, and it usually receives but little care in its selection and use. Specifications for sand are usually so brief and indefinite as to be of little value. This condition of affairs is probably due in a large measure to the lack of definite knowledge of the mortar-making qualities of typical sands and to a lack of appreciation of the fact that sands from different deposits differ greatly in their characteristics and that these characteristics exert a marked influence on the mortar or concrete made from the sands. In this bulletin are given the results of a series of tests on thirty-two samples of Illinois sands obtained from various parts of the state. The effect of the characteristics of the sand on the quality of the mortar is discussed. From these considerations a proposed classi-

Sampling and Examination of Mine Gases and Natural Gas is the title of Bulletin No. 42, published by the Bureau of Mines, Department of the Interior of the United States Government, Washington, D.C. The bulletin contains a full description of many tests and results obtained from these tests made to determine the composition of mine gases under various conditions. Several types of apparatus were used for the experiments, each being described in detail. The results of experiments made on natural gas produced some useful information of commercial value, especially with regard to the gasoline content of this gas. The data has all been carefully tabulated.

Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.

For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

Complete Foundry Plants

Grey Iron, Brass, Car Wheel, Pipe, Steel (O. H. & Converter) and Malleable. Designed, equipped and installed. With over thirty years' experience we are able to handle any foundry proposition, no matter of what size or for what class of castings. Do not fail to consult our experts when you need foundry equipment.

Catalogs and full information on request.

GANANOQUE, ONT.

Write to Us for Records of Actual Twist Drill Results—

WILT TWIST DRILLS are producing more holes per dollar of cost than were ever produced before. They are standing up to their work better. They are cutting faster and lasting longer. Actual figures prove these statements. Ask us for some of the records that WILT TWIST DRILLS have made.

WILT TWIST DRILLS are machined complete from the rough bar to the finished drill at a single chucking.

They are scientifically correct in contour—the machine is absolutely accurate and uniform, and the hardening is done in electrical furnaces that insure perfect results.

You will never realize what a difference there can be in drills until you have actually tested Wilt Drills in your own shop.

The Wilt Twist Drill Company of Canada, Limited

We Specialize in ELECTRICAL REPAIRS

The experience we have gained by repairing the machines of all makers, all sizes, all voltages, and currents is rarely secured by the manufacturer. If he makes your repairs it may be as good as before, but no better. When we tackle a job it is our aim to make the weak part stronger than the original—and we invariably do it.

A Job Well Done is an Ad. for Ever

It will benefit you to try an M.E.C. Collapsible Tap

on your difficult tapping. Peculiar construction of Chasers prevents fine chips disturbing action of Tap and accuracy of threads tapped. Write for particulars and take advantage of our 30-day trial offer.

MANUFACTURERS EQUIPMENT CO.
173 North Jefferson St.. CHICAGO, ILLS.

Hardness and Toughness

Trade Mark

The cutting and wearing qualities of a drill depend largely upon the hardness and toughness of the steel used. And hardness and toughness depend upon the method of tempering. Every step in the process of tempering

"Detroit" Twist Drills

is marked by exacting care and supervision, scientific knowledge, the most modern equipment and 28 years' experience. Consequently "Detroit" Drills have the highest cutting and wearing qualities. Their use insures clean, fast, accurate drilling; they save time on every job.

Let a test prove it.

Write today for Catalog "R"

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use **two** files where they heretofore only used **one.**

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

Nicholson-Made-Files

Our No. 18 BUFFER

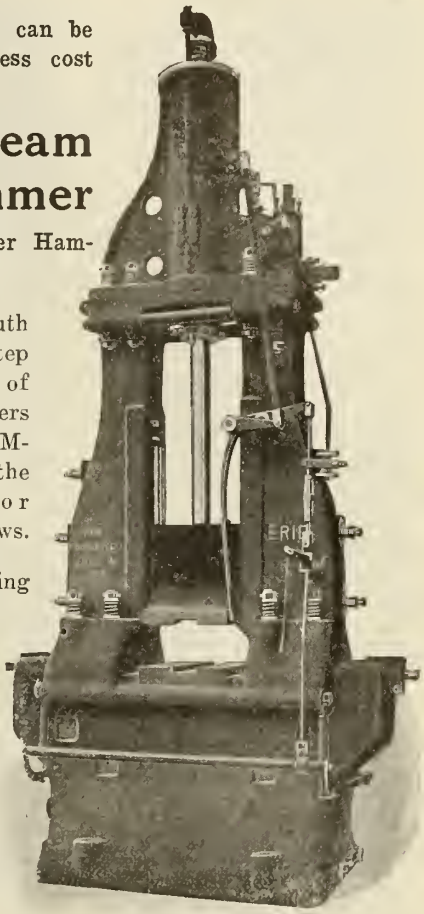
is a necessity to every machine shop. Constructed from the very best metals and thoroughly up-to-date in every respect.

It is **absolutely guaranteed** to meet with the users' complete approval. This is a **Buffer** that has "**made good**" with other firms. **Why hesitate about giving it a trial?**

Full details and prices on request.

Valley City Machine Works
20 Compau Street, GRAND RAPIDS, MICH.
Selling Agents in Canada: Williams & Wilson, MONTREAL. General Supply Co. of Canada, OTTAWA and TORONTO.

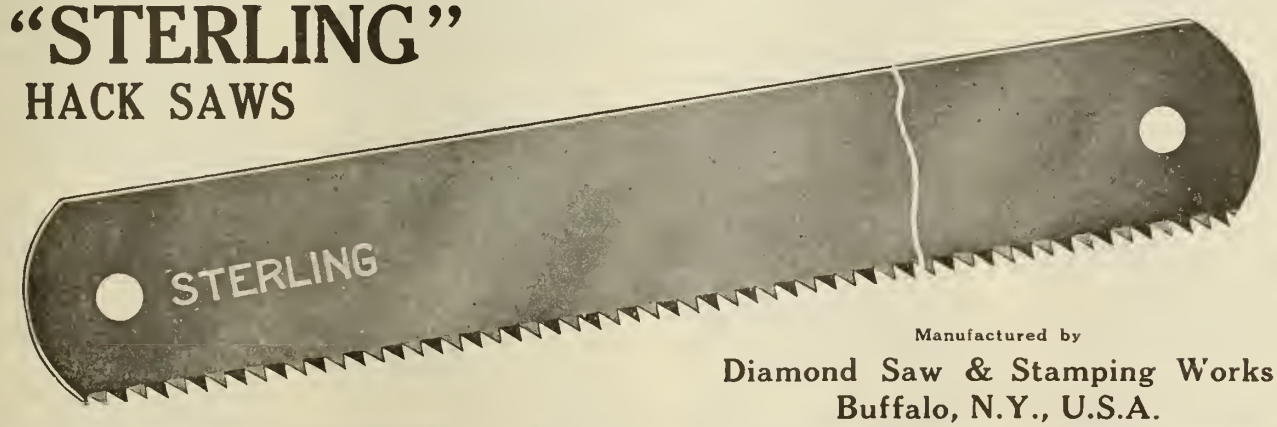
More drop forgings can be produced and at less cost with an



"Erie" Steam Drop Hammer

than with any other Hammer on the market.

If you doubt the truth of that statement, step into the factories of some of the large users of "ERIE" HAMMERS and ask the man responsible for production. He knows.



We build Trimming Presses also.

Send for bulletins.

Erie Foundry Company
Erie, Pennsylvania

"STERLING" HACK SAWS

Manufactured by
Diamond Saw & Stamping Works
Buffalo, N.Y., U.S.A.

PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

Canada Wire & Iron Goods Co., Hamilton

We also manufacture

- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

Friendly Toward The Firm

How much is your employees' friendship worth to your firm?
Do they think of your plant as a place to work in? or—
Do they think of it with a feeling of interest?
Wouldn't you think more highly of a firm that gave you a clean, tidy, individual place to put your street clothes when you donned your working togs, and vice versa—that gave you a place of safety for your lunch—than of a firm where you were just a mere employee whose comfort was not considered.
Think it over and let us send you some information regarding our locker equipment, which makes workmen happy, and which pays for itself in the goodwill, system and order it promotes.

Steel Shelving and Bins, too.

The Dennis Wire & Iron Works Co. Limited
LONDON; CANADA

LUFKIN

TAPES AND RULES

NOTED FOR ACCURACY

We make a complete line of
MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES

Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

Catalogue on request.

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

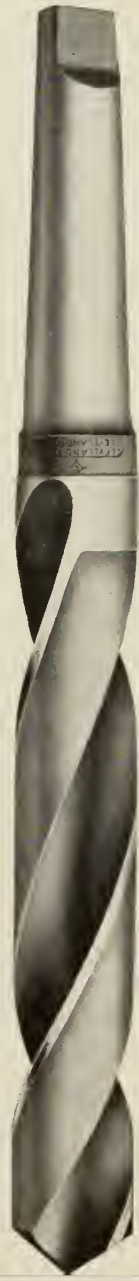
CERTAINLY!

CLEVELAND DRILLS WILL COST YOU A TRIFLE MORE IN THE FIRST PLACE, BUT SINCE THEY WILL DRILL A FAR GREATER NUMBER OF HOLES THAN OTHER DRILLS, THEY ARE, IN THE LONG RUN



MUCH LESS EXPENSIVE FOR WHAT YOU WANT IS HOLES NOT DRILLS

DO NOT BE MISLED BY THE PRICE QUESTION. A GIFT DRILL IS TOO EXPENSIVE IF IT CAN'T DO THE WORK . . THE ONLY TEST OF A DRILL'S TRUE WORTH IS THE NUMBER OF HOLES IT WILL DRILL BETWEEN GRINDINGS AND THE NUMBER OF HOLES IT WILL DRILL BEFORE IT IS SCRAPPED . . WE BELIEVE CLEVELAND DRILLS WILL DO MORE WORK UNDER PROPER FIXED CONDITIONS THAN ANY OTHER DRILL IN THE WORLD AND WE . . . INVITE COMPARATIVE TESTS . . .

SLOTTING ROUND PIECES ON

P. & W. SPLINE MILLER

This Most Efficient Machine, Equipped with Simple Fixture, Turns Out Work with Great Rapidity and Lowest Cost.

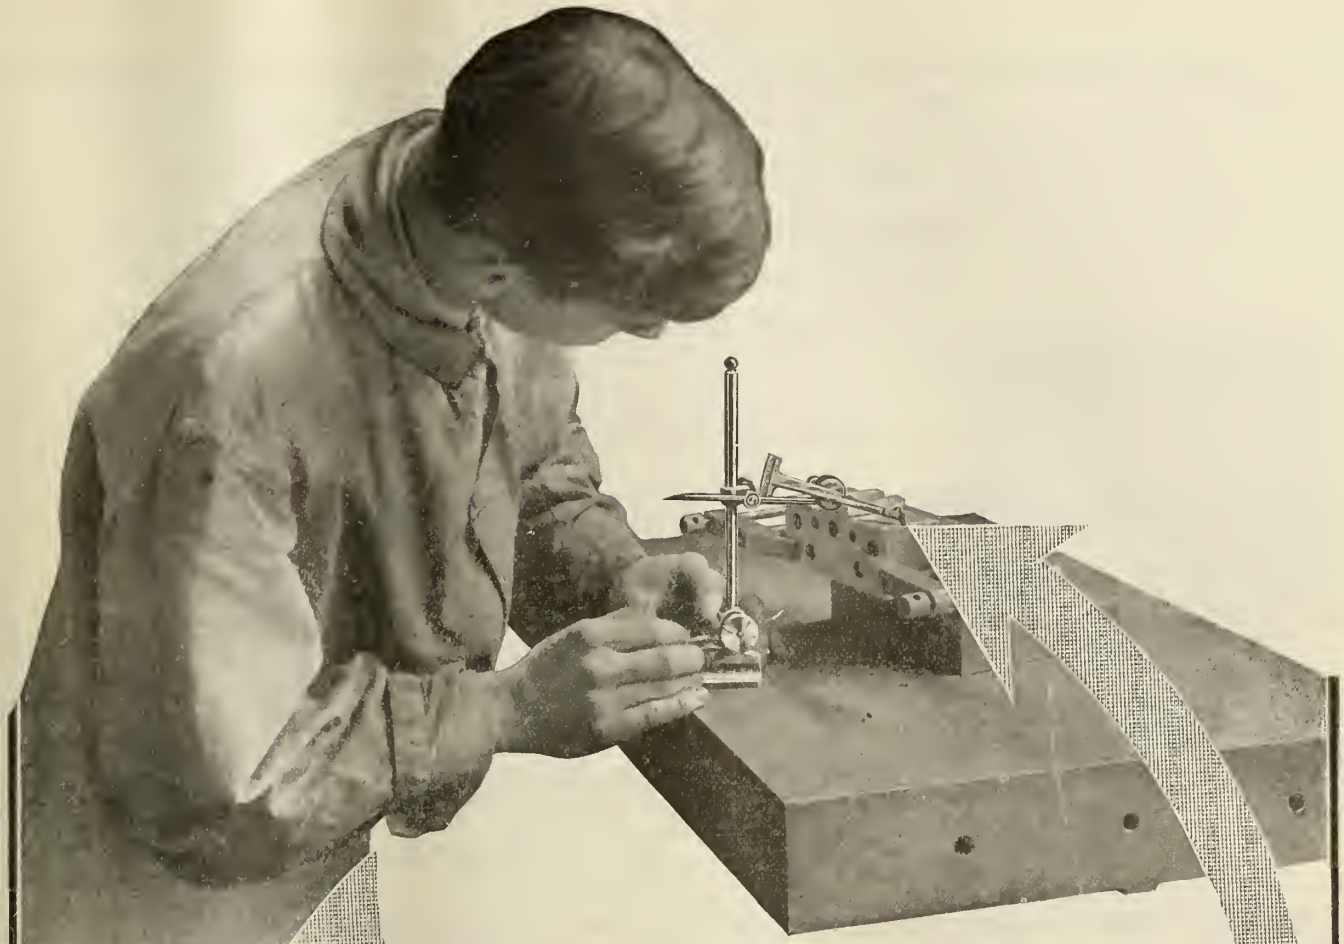
Two Cutters Working Simultaneously.

The secret of the great production capacity of this little machine lies in the double cutter system. Two fish-tail cutters, one on each side, running at high speed, are fed into the work while the table is being fed back and forth between the cutters. It is a case of continuous cutting from the solid blank to the finished hole. Starting holes do not have to be drilled.

Automatic Features Reduce Costs.

The automatic features which enable one operator to keep several machines busy, in conjunction with the inexpensive and durable type of fish-tail cutter, reduce the operating expense to a minimum.

Various Adjustments Easily and Quickly Made.



The adjustments of the cutter speeds and feeds and table feeds and length of stroke, are all made by simple, convenient means.

Write for Circulars "Spline Milling Machine," giving description and applications, also "Spline Milling Machine for Feather System of Keying."

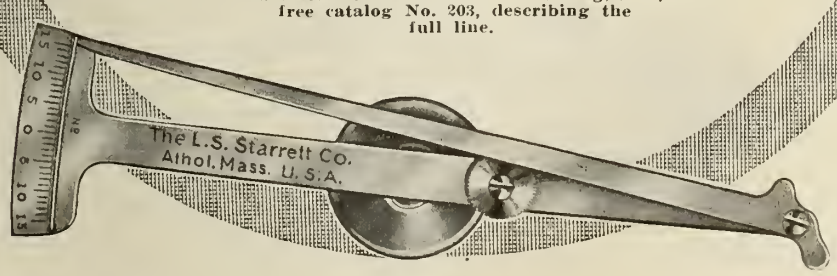
Precision Jig Work Requires Good Men and Perfect Instruments

When high-priced mechanics are working on valuable jigs or dies it does not pay to take chances on wasting their time and spoiling the job by using cheap instruments. That is why this man is using a



Starrett Surface Gage and Test Indicator

He places absolute confidence in the accuracy of the measurements he obtains with Starrett tools.

Furthermore, he appreciates that they are so designed as to permit the most rapid work consistent with perfection. Their use by such men as this establishes Starrett tools as the Standard Instruments of Precision.

Starrett tools are sold at all good hardware stores. Send to us for our big, new, free catalog No. 203, describing the full line. 42-280

STARRETT HACK SAWS CUT QUICKER LAST LONGER

The L. S. Starrett Co., Athol, Mass.

World's Greatest Toolmakers

NORTON

Loading in cylindrical grinding is frequently caused by running a wheel too slow, especially when crowding a hard wheel. At slow speed with plenty of power the grains would withstand this crowding without breaking away.

The way to overcome this is to use not only

NORTON GRINDING WHEELS

Alundum for Steel **Crystolon for Cast Iron**

at the proper speed but also to call freely upon such grinding facts as our experience has enabled us to collect.

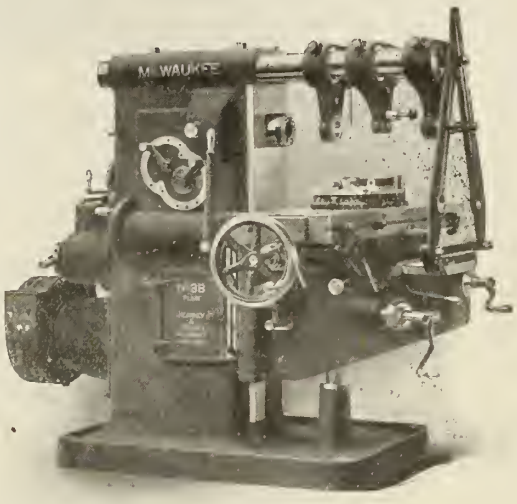
Using a Standard Cutter for a Special Cutter Job by Means of the Universal Milling Attachment

The illustration shows a view of a Universal Milling Attachment taken from the rear of a Milwaukee Plain Miller. The cutter is milling a bevel across the top of a milling machine knee.



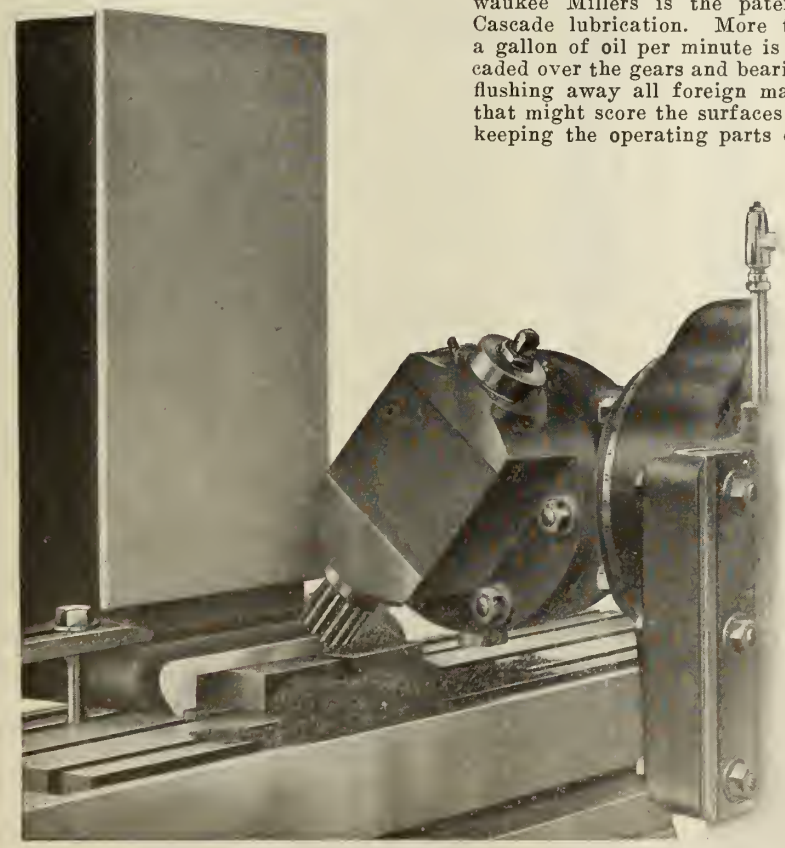
If the machine with its regular equipment were used on this job, a special cutter would have been required. However, by means of the Universal Milling Attachment it is possible to do the work with entire satisfaction, using a standard square-end face milling cutter.

There are a great variety of jobs that can be done with standard cutters used in connection with the Universal Milling Attachment, so saving the expense of special cutters. This is especially desirable on jobs where the quantity is not large, and which, therefore, could not be done because of the expense incidental to the making of special cutters. The advantage of saving the time required for the making of special cutters is also often very important.

The Universal Milling Attachment for Milwaukee Millers differs from others in that it is an extremely powerful and practical attachment that is capable of sustaining severe and continuous service. It is not limited to very light work. It is made to withstand heavy work, and can be used to good advantage on day-to-day work, as well as on the unusual and occasional job. All gears in this attachment, as well as all gears in Milwaukee Millers, are made of hardened steel.

We could do nothing else but make our attachments excellent in every respect. Otherwise they would fail to measure up to the excellence of our machines. Milwaukee Millers have built up a well-deserved reputation for excellent construction and excellent service by reason of the many exclusive and extremely valuable features and of the mechanical correctness of every last detail.

One of the best and most widely commended features of Milwaukee Millers is the patented Cascade lubrication. More than a gallon of oil per minute is cascaded over the gears and bearings, flushing away all foreign matter that might score the surfaces and keeping the operating parts cool.



This continuous lubrication, coupled with the use of highly-finished, hardened steel gearing, secures a speed arrangement which it is almost impossible to wear out.

Among other features of Milwaukee Millers are:

Double over-arms—Don't fail to investigate this latest and most valuable improvement. One-piece box section knee, with solid top. Box section column cast in one piece and strongly ribbed. Constant speed drive. Flanged spindle. Efficient cutter, lubricating system, etc., etc.

The Bulletin giving the complete facts about Milwaukee Millers make about the most valuable reading that the milling machine user can find. Have you sent for your copies? There's no better time than now.

We are always glad to consult with you on any problem or phase of milling work.

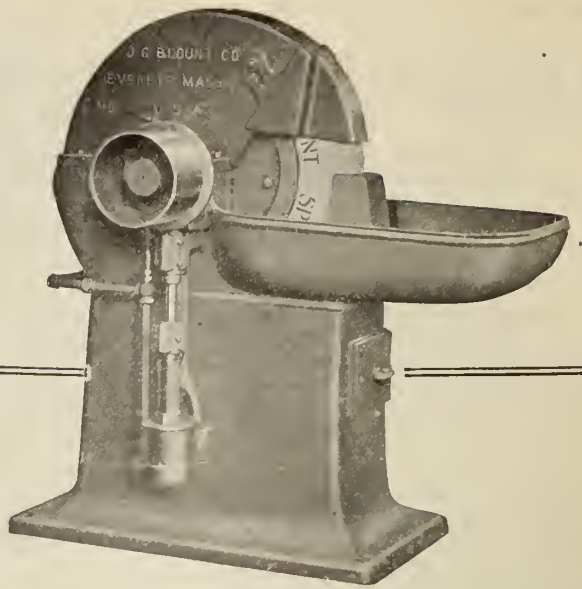
Foundry grinding facts and figures are proving the efficiency of

CARBORUNDUM GRINDING WHEELS

UNDER the every-day working conditions they are increasing and bettering the output of the foundry grinding departments.—They cut clean, quick, and free—hold their shape—show long life—saving time—saving the men.

The Operators Prefer Carborundum Wheels



They are easier to handle, require but little dressing, and enable them to increase their tonnage.

For brass, bronze, cast iron, or aluminum—*Carborundum*. For malleables and steel castings—*Aloxite*.

Our service department gives you the right wheel in the right place

The Carborundum Company
Niagara Falls, N. Y.
New York Chicago Philadelphia Boston Pittsburgh
Cleveland Cincinnati Milwaukee Grand Rapids

This is our New Improved Wet Tool Grinder—an ideal machine for your grinding needs. It is of extra heavy construction throughout, and all bearings are of large proportion and self-oiling.

The packingless vertical centrifugal pump furnishes a liberal though easily regulated supply of water to the face of the wheel; the large water-pan prevents water splashing on the floor.

This is one of the best wet-grinders made. Built in 14, 20 and 30-inch size. **Get our catalog, which describes it in detail.**

The R. K. LeBlond Machine Tool Co., Cincinnati, Ohio

Canadian Agents—The A. R. WILLIAMS MACHINERY CO., Toronto, Montreal, Winnipeg

No business, large or small, can afford to waste money by paying more to manufacture its product than is necessary. If your pipe threading is too high, let us help you lower it.

The illustration shows the No. 4 P.D.Q.C. Improved single pulley drive. Eight spindle speeds are obtained from a constant speed pulley or motor. A gripping chuck on each end of the spindle takes care of long lengths of pipe. They are equipped with the Peerless Die Adjusting Mechanism, so that when a change of dies is required, it is not necessary to remove a screw or a plate. There are no complicated parts to adjust and no light, delicate mechanism to break or get out of order. The driving mechanism is compact and almost entirely concealed in the bed. The cut-off device is attached to one of the steady slides, which places the cutting-off tool near the point of support. The bottom of the bed slopes toward the rear, draining the oil into the back away from the chips.

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Electrical Driving of Winding Engines and Rolling Mills *

By C. Antony Ablett, A.M. Inst. C.E. and H. M. Lyons, A.M.I.E.E.

Each inroad made by electricity into fields long held by the steam engine usually marks a distinct advance in engineering science. The authors show that the electrification of mine hoists and rolling mill machinery is not only fully as feasible as that of railways and other well-known applications, but that it has much greater flexibility in admitting of automatic control, safety devices, etc.

THE use of electrical machinery for driving hoisting engines in mines, and reversing rolling mill plants in steel works is comparatively recent; the first winders of importance having been introduced in 1902, and the first electrically driven reversing rolling mill being installed in 1906, though non-reversing rolling mills were driven electrically some eight or ten years earlier. The developments along these lines have been extremely rapid, as is shown by the fact that at the present time about one thousand large winding engines and nearly sixty reversing rolling mills are being driven electrically, and still greater developments may be expected in the future.

Under these circumstances a paper dealing with the modern aspects of the subject and giving the results of the experience obtained in the past would appear desirable.

The earlier winding engines were extravagant in power and had the disadvantage of drawing very heavily upon the source of electrical supply at the moment of starting. It was, therefore, impossible to use them on systems where the supply of current was limited, and even on comparatively large plants their use resulted in serious interference with other machinery. These disadvantages were, however, practically done away with whom the Ward-Leonard system and Ilgner's adoption of the flywheel to this system were introduced, but the last few years have seen greater improvements in the Ward-Leonard and the Ilgner system. The present paper will deal chiefly with the development of these systems by the various Siemens companies, who have installed about half the total plants in existence, and with whom the authors have the honor to be associated.

Ward-Leonard System.

A short description of the so-called Ward-Leonard system, illustrated in Fig. 1, is desirable as an introduction. In this system a direct current motor is used to drive the winding engine or rolling mill, the motor being supplied with power fro ma direct current dynamo. The essential feature of this system is that the voltage supplied to the motor, and consequently the speed of the motor, is controlled by controlling the field current of the generator, instead of by varying the resistance in the armature circuit of the motor. Thus, as the field current of the generator is increased from nothing to a maximum, the motor speeds up from standstill to full speed, and if the field current of the generator is reversed, the motor reverses its direction of rotation. The system enables a very exact control of the speed to be obtained, because the speed of the motor is practically proportional to the strength of the generator field, whatever the load on the motor may be, while with any control system where resistances are inserted into the armature circuit of the motor, the speed would vary within very wide limits with a change of load rendering the exact speed control quite impossible.

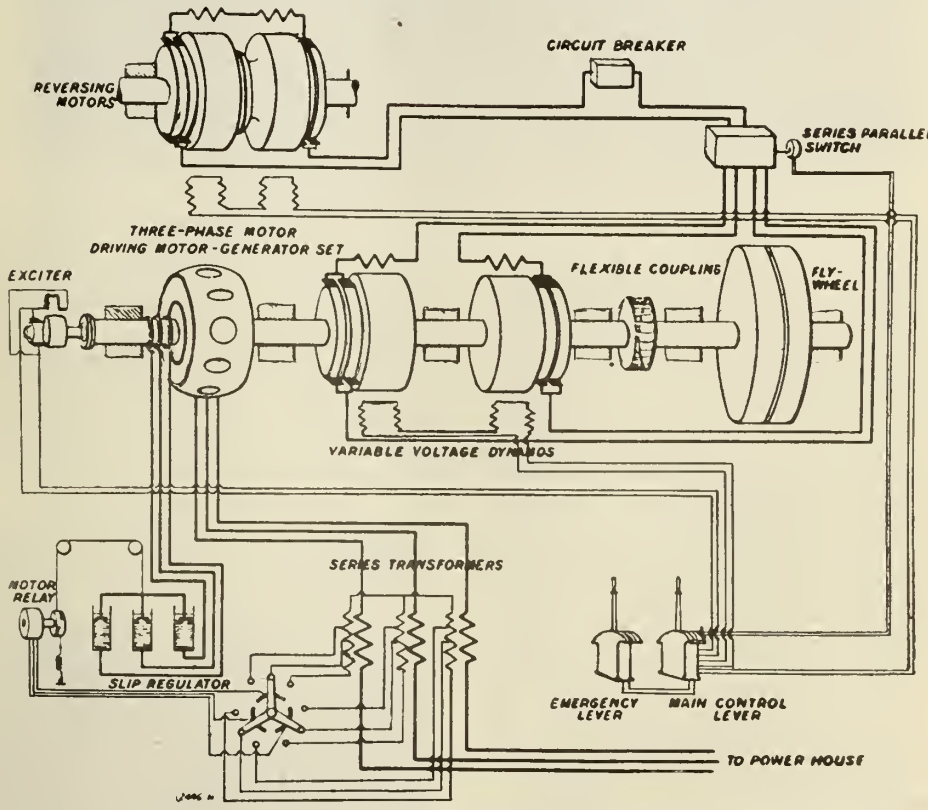

FIG. 1. DIAGRAMMATIC VIEW OF ILGNER SYSTEM OF DRIVING WINDING ENGINES OR REVERSING ROLLING MILLS.

The control of the dynamo field involves scarcely any waste of electrical power, but where resistances are inserted into the armature circuit, the loss of power may be, and usually is, very great. The field currents of the generator are small, so that the control mechanism is small, compact and very easy to handle; the armature currents are perhaps fifty times as great, so that any control mechanism which varies the resistance of the armature circuits is large, clumsy and difficult to handle, in fact a complicated relay system is often necessary to enable it to be handled at all. The dynamo used to supply the motor in the Ward-Leonard system is usually driven by a motor supplied from the available power circuit, forming a motor generator set, and this motor may be either direct current or three-phase, according to the power available. The dynamo may be and sometimes is driven by an engine, water turbine, or other prime mover, if this happens to be more convenient.

Application to Winding Engines and Hoists.

Speed Control. — The main control lever for operating the winding engine is coupled to the regulating resistance in the field circuit of the generator, so that

*Abstract of paper read recently before the Canadian Society of Civil Engineers, Montreal.

when this lever is in the mid position there is no current in the generator field. As the lever is moved in one direction, the generator field current increases, and as it is moved in the other direction, the generator field current is also increased, but in the opposite sense.

From what has been said in the introductory remarks it will be seen that when the lever is in the mid position, the winding engine is at a standstill, and that it starts and speeds up as the lever is moved from the mid position in one direction, while, if the lever be moved from the mid position the other way, the winding engine increases in speed in the other direction, its speed being practically proportional to the displacement of the lever from the mid position, and not affected by the weight of material being hoisted. The driver has not absolute control over the speed, for two cams are provided on the depth indicator, one for each cage, which operate levers coupled to the control lever in such a way as to prevent the cages being accelerated at too rapid a rate, and to slow up the winding engine at the proper point so that the bank is approached at a crawling speed. Provided that these limits set by the cams are not exceeded the speed of the wind is entirely within the driver's control.

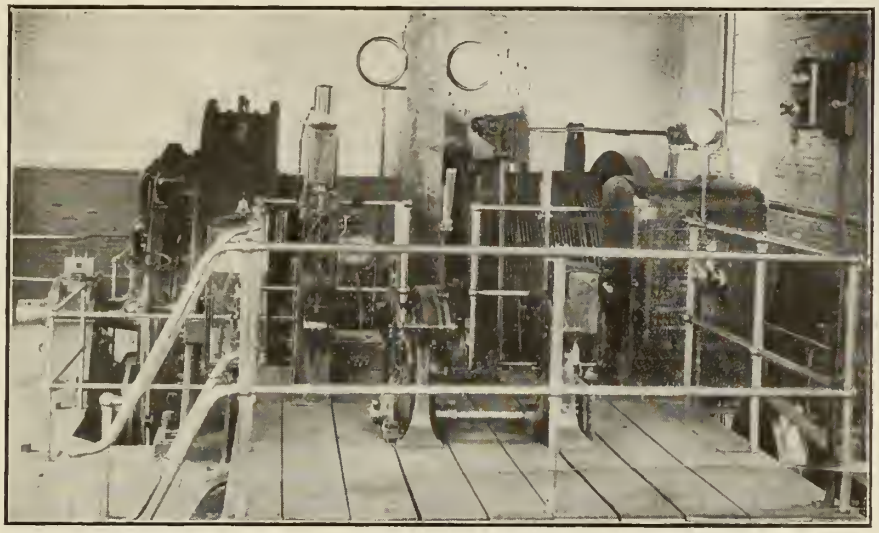

FIG. 2. WARD-LEONARD HOIST, LINGAN PIT, DOMINION COAL CO., SHOWING CONTROL LEVERS AND DEPTH INDICATOR.

Use of Flywheel.

Fig. 4 shows the typical horse-power diagram for a winding engine. The inertia of the drums, cages, head sheaves, material wound, and the ropes, which altogether weigh about 60 tons in this particular case, necessitates a horse-power at the end of the acceleration period of each wind of 1865, which is about three and a half times the average power demand of the winding engine, in this case 524 horse-power, and it is found that the maximum acceleration peak is usually between three and four times greater than the average demand.

The consumption of energy for this Ward-Leonard control rises gradually during the starting period, and the maximum is only reached at the end of the time of acceleration, i.e., from ten to fifteen seconds after the start, because the speed of the winding motor is increased while it is giving the requisite turning moment by increasing the field of the generator, and consequently there is no loss of power in starting.

Since this acceleration peak is of short duration and only comes on gradually, it is possible to supply Ward-Leonard winders from power stations of comparatively small total output, provided that the machines in the power station have a sufficient overload capacity to maintain their speed during peak loads, as is usually the case with steam turbo-generators where the generators are provided with modern voltage regulators. Where, however, this is not the case, and the acceleration peaks of the winding engine are large compared with the average demand on the power station, or where the winder is supplied through a long transmission line from a distant power station, it is sometimes necessary to couple a flywheel to the motor generator set. In this case provision must be made so that during a peak load the motor generator falls in speed, enabling part of the stored energy of the flywheel to be used to supply the heavy demand, and, when the load is small, the motor generator set is speeded up again, the surplus power being taken to restore the energy of the flywheel, so that the demand from the power house or supply system is maintained at about the average. This is the Ilgner system, so-called after the engineer who first used it in practice.

Fig. 5 illustrates the effect of the flywheel in equalizing the load taken by the winder. It will be seen that the current taken by the winding motor varies between +1900, and—1,000 amperes, while the current taken from the supply system is maintained practically constant at 400 amperes, the maximum voltage supplied to the winding engine and the supply voltage being the same.

The following example will give an idea of the power taken by the Ilgner system under practical working conditions with a winding engine arranged to wind 240 tons per hour from a depth of 1,960 feet, making as a maximum 44½ winds per hour, where the flywheel is used whenever the full output is being wound at the full speed, but where a lesser output is being wound at reduced speed, so that the acceleration peaks become less serious, the flywheel is uncoupled to save power. These results are conveniently expressed in terms of the kilowatts taken by the electric winding engine plant per shaft horse-power.

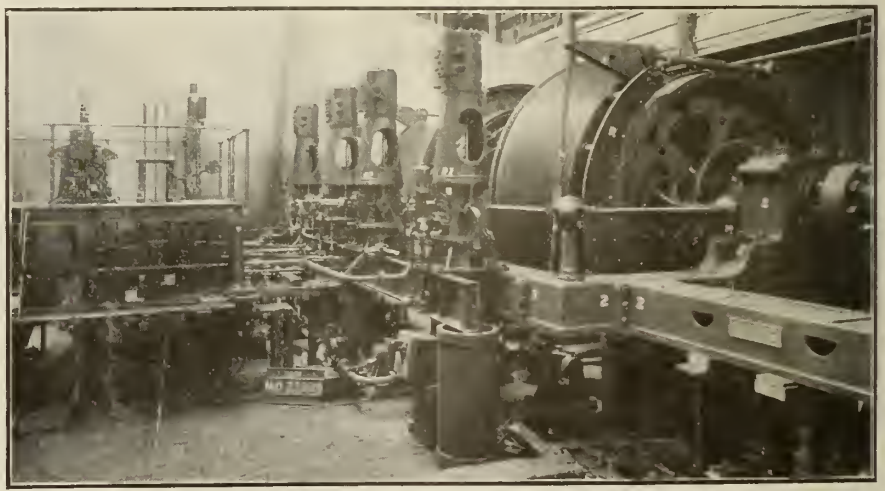

FIG. 3. CONICAL DRUM WARD-LEONARD WINDER, AT THE CANADIAN COLLIERIES COMPANY'S CUMBERLAND COLLIERY, SHOWING BRAKE GEAR AND CONTROL LEVERS. DEPTH, 1,000 FEET; NET LOAD PER WIND, 3½ TONS.

	Output tons per hr.	K. W. per S.H.P.
With flywheel	240	1.49
"	160	1.60
"	108	1.77
Without flywheel ..	160	1.35
" ...	108	1.48

It will thus be seen that, when working the winding engine on the Ilgner system, there is an increased loss of power of from 16% to 17%, as compared with the Ward-Leonard system, and, naturally with the latter where the flywheel is uncoupled, the resistances are cut out of the rotor circuit of the three-phase motor to avoid loss of power.

To avoid misunderstanding of the above results, it should be specially pointed out that shaft horse-power (S. H.P.) is taken to mean the actual work done in raising the load, i.e., if the actual weight of coal or ore, expressed in lbs., which is raised per minute be multiplied by the depth of the shaft in feet, and divided by 33,000, the shaft horse-power is obtained. The shaft horse-power thus does not include the mechanical friction of the winding engine, the sheaves, the guides or the rope losses, and the figure of the kilowatts divided by the shaft horse-power brings in the mechanical efficiency, as well as the electrical.

Details of Ilgner System.

Flywheels are usually designed to equalize the load by falling in speed from 15 to 20 per cent., and it is found that this entails a loss of power in the slip regulator of about 7½ per cent. to 10 per cent. The flywheel is usually coupled to the motor-generator set by means of flexible coupling, though in some very recent Ilgner motor generator sets, where there happens to be no advantage in running with the flywheel uncoupled, the electrical machines and the flywheel are arranged to be carried by two bearings only, reducing the first cost and the friction losses.

Of recent years, the capital cost of Ilgner plants has been greatly reduced, owing to the adoption of higher speed for the motor generator sets, and to the improvements in the manufacture of such flywheels, which enable them to run at very high peripheral speeds compared with those used in the earlier winding engines. For example, the provision of flywheel capacity to equalize peak loads of 60,000 horse-power seconds, in the early days of Ilgner winding, where peripheral speeds of 15,000 feet per minute were used, would require two flywheels of a total weight of about 80 tons, the friction and windage loss of which would be about 150 horse-power. Under modern conditions where the regular peripheral speeds are 27,000 and 30,000 feet per minute, a single flywheel of 22 tons weight would be used, instead of the two flywheels having a total weight of 80 tons, and the friction and windage losses would not exceed 100 horse-power.

FIG. 5. DIAGRAM SHOWING THE EQUALIZING EFFECT OF THE FLYWHEEL ON ILGNER'S ADAPTION OF THE WARD-LEONARD SYSTEM. THE WAVEY LINE AT ABOUT 400 AMPERES IS THE CURRENT TAKEN FROM THE SUPPLY SYSTEM. THE CURVE WHICH SHOWS THE GREAT VARIATIONS REPRESENTS THE CURRENT TAKEN BY THE WINDING ENGINE.

The Ilgner system was used on practically all the early European winding engines, but as at the present day, power stations are being installed of much greater capacity than those of a few years ago, and high speed turbo-generators of large overload capacity are being adopted, the Ward-Leonard system at the present time is being used to a much greater extent than the Ilgner system for winding engine work.

The Systems Compared.

Generally speaking, the Ilgner system of winding may be preferable to the Ward-Leonard system in the following cases:—

(1)—When the time occupied by the wind is short.

(2)—For vertical shafts.

(3)—For large outputs.

(4)—Where the winding speed is very high.

The above conclusions may be considerably modified by the nature of the electrical supply. Where the power station is small or the winder is supplied through a transmission line of considerable length, the Ilgner system will be more suitable, but where the power sta-

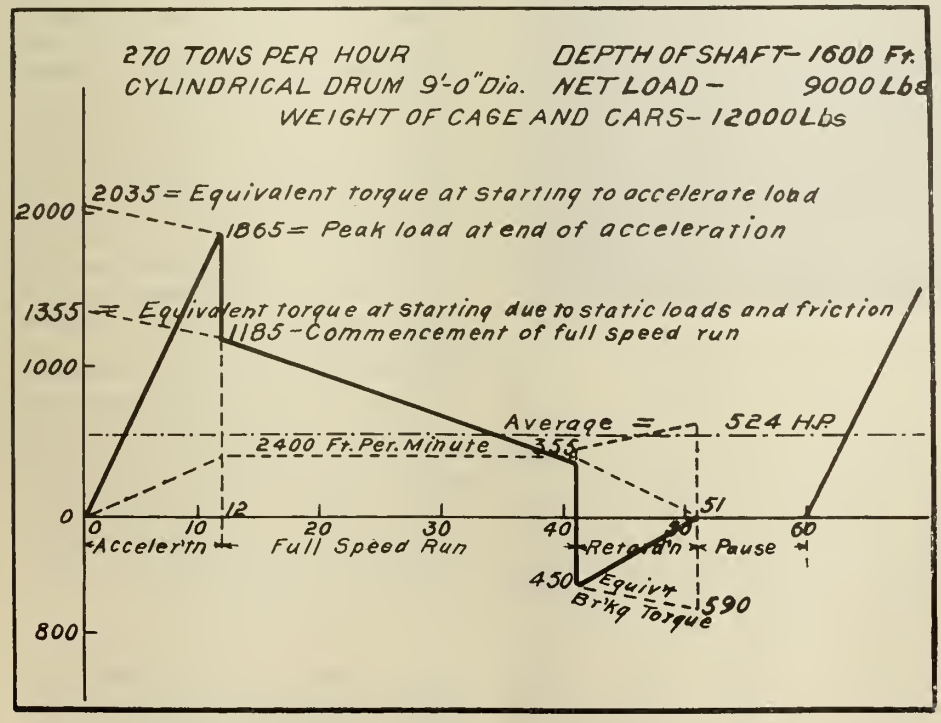

FIG. 4. TYPICAL POWER DIAGRAM FOR A WARD-LEONARD WINDING ENGINE.

tion is large and near the winder, the Ward-Leonard system is the better. Where there are a number of winding engines supplied from the same power station, the Ward-Leonard system would prove very suitable, because the combined effect of these winding engines working together will be to reduce the percentage of fluctuations on the power station load. Fig. 6 gives an illustration of this principle, and shows a case where three rolling mills are supplied from a single power station, and although the load of each one varies about 73 per cent., the total fluctuation in the power station load is about 28 per cent.

Brake Gear.

The mechanical brake is so arranged that, when required to be brought into action, it is actuated by a weight at the end of a lever, but normally held off the drum by an air cylinder. Under normal conditions the cams on the depth indicator actuate the control lever, so that the cages approach the bank at a very slow speed. When they reach the bank, the driver brings them to rest by means of his control lever, and then puts on the mechanical brake to hold the cages in position by means of the brake lever. The brake lever is interlocked with the control lever, so that the driver cannot put on the brake by means of the brake lever until the control lever is at about its middle position, i.e., unless the cages are moving at a comparatively slow speed.

To enable the driver to stop the winder in case of any emergency arising, a third lever, the emergency lever, is placed on the driver's platform and, if this be operated, it puts on the mechanical brake through the emergency gear and at the same time cuts off the excitation from the dynamo of the motor generator set.

Safety Devices.

From what has been said, it will be seen that the brake is applied by the positive action of the weighted lever, and, if the air pressure should fail, the brake is promptly put on. The armatures of the winding motor and the generator are permanently connected by heavy cables, and there are no cut-outs or switches in this circuit, so that the circuit between the armatures cannot be interrupted; electrical braking is always available as well as the mechanical brake, unless the excitation should fail.

As mentioned above, cams are provided on the depth indicator which keep the acceleration within safe limits, and the cage is brought gradually to a slow speed by the time it reaches the bank. An overwind device is provided, usually both on the depth indicator and in the shaft, which puts on the mechanical brake through the emergency gear and cuts off the excitation should the cage overwind the bank, thereby bringing the winding engine instantly to a stop. Should the air pressure or the excitation fail, the mechanical brake is put on by means of the emergency gear. When men are being wound the throw of the main control lever is limited by means of a switch on the bank, so that the winding engine cannot be run above a certain speed.

Where electrical driving is adopted, it is very easy to provide safety devices, and all those mentioned are designed to protect the plant against careless handling, but if the majority of safety devices were dispensed with, the Ilgner and the Ward-Leonard winder would still be better protected against careless handling than the steam winder. The fact that it is impossible for an Ilgner or a Ward-Leonard winder to race or run away makes it inherently safer than the steam winder.

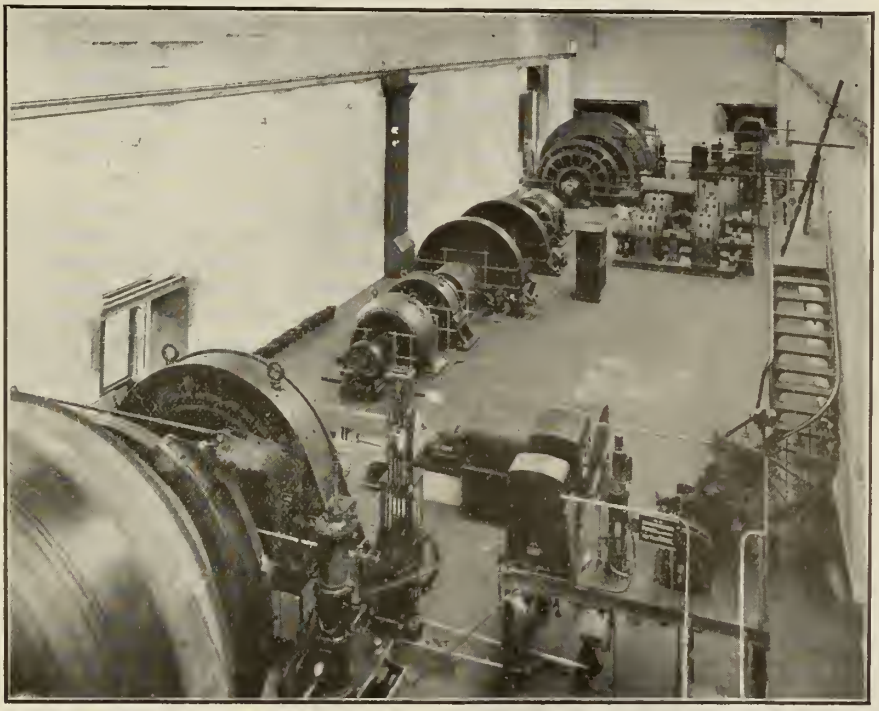

FIG. 6. GENERAL VIEW OF WINDING ENGINE EQUIPMENT, MARKHAM STEAM COAL CO. PLANT, SHOWING BOTH WINDING ENGINES.

DOMINION ENGINEERING & MACHINERY CO.

EARLY in May, Vaughan Cowell & Co., of London, Englind, will bring out in that market an issue of probably $500,000 of Dominion Engineering & Machinery Co. preferred stock. This company is being formed with a Dominion charter to take over the old and well regarded Toronto concern, the Ontario Wind Engine & Pump Co., Ltd., which has been in business in Toronto since 1894.

The new company will be capitalized at $2,000,000, in equal amounts of cumulative participating preference stock, and common stock. The preferred stock will bear 7% and when the common has received an equal amount, the preferred will participate to the proportion of one-third to two-thirds in any additional surplus which may be distributed. The former directorate and management, will remain as before, the only addition to the board being the representatives of the London interests.

The business for purposes of valuation has been appraised by the Canadian Appraisal Company and the books audited by Thorne, Mulholland & Co., chartered accountants of Toronto. The company manufacture agricultural machinery, pumps, wind-mills, tanks, gasoline engines, etc. The new capital will allow extensions of business and incidentally repay bank advances and it is hoped that the previous output will be almost doubled.

The Ontario Wind Engine & Pump Co.'s balance sheet as at December 31, shows assets of $1,816,406, of which $614,000 is capital, and some $440,000 reserve accounts of various kinds. The company has borne an excellent reputation and if the same careful management is shown in the future there should be no change in this respect.

Safety appliances are important, but careful men are needed to prevent accidents.

Concerning the Supply and Erection of Machinery

The points dealt with in the accompanying article which appeared in a recent issue of the "Contractor," are just those often overlooked when signing some agreement involving either the supply, delivery and erection, or all three, of building material, machinery equipment, etc. The numerous and apparently increasing appeals to our law courts concerning the letter and spirit of contracts entered into, show that there is much slackness in formulating the initial understanding.

EVERY order for the supply and erection of machinery involves the creation of a contract of some kind between a person who may be termed "the employer" on the one hand, and a manufacturer on the other. It often happens that the employer has but little technical knowledge of the machinery which he desires to purchase. In these circumstances, if he be wise, he makes a stipulation that the machinery itself, the mode of erection and the efficiency of the plant shall be all subject to the approval of an engineer or other person nominated by him. If the work has to meet the approval of a skilled person, it is obvious that the manufacturer must pay close attention to the legal incidence of the contracts into which he enters. In the first place, he should be careful to have the contract put into writing. If the plant be for a municipal corporation or other local authority, he should insist upon the document being sealed; for although the seal may not be necessary in every case, it is always best to be on the safe side.

Contractor's Primary Duty.

Before agreeing to erect works of any magnitude, the contractor should make a careful examination of the premises and of the ground upon which the foundations of his engines are to be laid. To draw attention to this may seem superfluous; but numerous cases have arisen in practice where contractors, relying upon the specifications prepared by the employer's engineer, have made no tests on their own account. The result has been that the proper fulfilment of the contract within the limits of reasonable profit has been found impossible. Where a contractor undertakes to install plant of a certain specified power, he must fulfil his obligation to the letter. If he has undertaken to provide an engine of 10,000 h.p., it will not suffice to supply an engine of 9.950 h.p. That would not be a fulfilment of the contract, and so far from getting any portion of the contract price, the contractor might be compelled to remove the engine and pay damage for breach of agreement.

Supervising Engineer's Responsibility.

The employer's engineer, who is generally named in the contract, occupies a peculiar position. The contractor is entirely in his hands. Unless the engineer grants his certificate, which is usually required to be in writing, the contractor can recover nothing, nor can he sue the engineer for refusing to grant a certificate of approval. The only exception to this rule occurs in the case where it is proved that the employer and the engineer have fraudulently agreed to withhold the necessary certificate. In such a case, the contractor would have a right of action against both the employer and the engineer. It should perhaps be mentioned, for the comfort of the contractor, that the employer is also bound by the decision of the engineer upon any matter which is left to his decision by the contract. He may not like the look of the work when completed; he may imagine that the output of power, or that the working of the machinery, is unsatisfactory, but he is bound by the engineer's certificate.

The engineer is, however, not altogether immune. Thus, if it be his duty to supervise the work in the course of erection, and to see that the contractor uses proper materials, he may be held liable to the employer for negligence in allowing the contractor to evade his obligations. For instance, suppose that the foundations for a generating plant were to be laid in concrete mixed in certain proportions, the concrete to be approved by the engineer. If, after the completion of the work, the foundations gave way owing to the use of material which did not comply with the specification, the engineer might be held liable for negligence.

The Extras Feature.

In addition to the power of approving the work, the duty of making allowances for extras is often entrusted to the engineer. Close attention should be paid by the contractor to this question of extras, for it is probable that there never was a contract yet in which some question did not arise on this head. Unless the contract provides for extras, the contractor may find himself doing extra work at his own cost. For instance, if he has to erect plant complete for a lump sum, and he finds in the course of erection that the addition of some further piece of apparatus or the use of more expensive material would be an improvement, he could not recover the additional cost if he incurred it without authority. As a rule, however, the question of extras is left to the engineer; and here it is desirable to warn the contractor of the necessity for seeing that power to allow payment for extras be expressly conferred upon the engineer by the contract between the parties. Unless the employer has entrusted that power to the engineer, he cannot be held liable for anything which the engineer may order.

Set Date of Completion.

Nearly every contract contains a provision that the work shall be completed by a certain time, the contractor being subject to penalties in case of default, or in some rare cases entitled to a bonus in case of expedition. Time is of the essence of a contract of this kind, and the contractor is in danger if he fails to perform it to the letter. As a rule, however, the question of time is also left to the discretion of the engineer, power being conferred upon him to give more time if he thinks fit. The contractor should take care to see that the contract contains a clause to this effect, for the engineer cannot extend the time unless specially authorized to do so.

Failure to erect machinery within the specified time may lead to grave consequences for the contractor. In one case the defendant agreed to fit up and complete machinery for the plaintiff within a reasonable time, but failed to do so. It was held that the jury, though not bound to assess the damages at the amount of profits under a contract with a third party which the plaintiff was prevented from earning, yet might do so if they were satisfied by reasonable evidence that the plaintiff would have earned these profits if not prevented by the breach of contract.

Guarantee Period of Maintenance.

Many contracts for the erection of plant contain clauses providing that it be maintained in good working order for a prescribed period. The contractor should take care to make it a condition of his liability that the plant should be carefully handled, and that it be operated by experienced workmen. As an instance of the immense burden which a maintenance or repairing clause may place upon a contractor, reference may be made to a case where there was a covenant to build a bridge in a substantial manner and to keep it in repair for a certain time. The bridge was broken down by an extraordinary flood. It was held that the contractor was liable to rebuild it.

In such a case, however, it will not be allowable for the employer to remedy defects without giving notice to the contractor, and letting him have the option

of doing the work himself. For instance, in an American case a contractor agreed to build an elevator under contract, which provided that if, after trials there was any "deficiency in the working of any of its parts, such parts shall be removed and replaced with new and acceptable work." The elevator was not of the stipulated capacity, so the employer, without giving notice to the contractor, spent money on it to put it right. It was held, however, that he could not recover the sums so expended from the contractor.

Power Supply Contract.

Having dealt with the general aspects of contracts for the erection of machinery and plant, it remains to consider certain points which may arise in special cases. Thus, suppose there is a contract to supply power, what are the obligations of the party supplying it? In one case the plaintiffs agreed to become tenants of a room in a factory in which there was an engine, which was used to operate machinery in the building, including a machine in the room let to the plaintiffs, and the defendants agreed to supply power for the working of that machine.

The question was whether the defendants were liable for an accident to one of the plaintiffs' workmen. The accident arose from the power which worked the plaintiffs' machine doing so in so violent a manner, and at such velocity, that the drum of the machine burst, and a workman was killed by being struck by one of the pieces. As employers, the plaintiffs were liable to pay compensation to the widow of the workman, and they brought an action to recover as damages the sum which they had to pay. It was decided by the Court of Appeal that the obligation of the defendants to supply power did not arise upon a demise, but upon a specific contract, which, in the absence of special conditions, involved that the power supplied should be reasonably fit for the purpose required, and that the defendants were liable for the consequences of a breach of that contract.

Where, as frequently happens in the case of a tenement factory, the owners of the factory supply power from a central plant to a large number of independent manufacturers, they would do well to consider the advisability of so limiting their liability that they cannot be sued for the damages caused by the main engines racing or by other accident.

CANADIAN PIG-IRON OUTPUT IN 1913.

THE production of pig iron in Canada in 1913, as shown by figures collected by the Bureau of Statistics of the American Iron and Steel Institute, amounted to 1,015,118 gross tons, against 912,878 tons in 1912. Of the 1913 total 986,848 tons was made with coke and 28,270 tons with charcoal, coke and electricity. The numbers of furnaces in blast in Canada at the close of 1913 was 10, of which 6 were in Ontario and 4 in Nova Scotia. Seventeen furnaces were active at some time in 1913.

The production of basic pig iron in 1913 was 558,524 tons against 489,799 tons in 1912; of Bessemer pig iron, 227,662 tons against 228,742 tons; of foundry pig iron and ferrosilicon 225,231 tons against 194,208 tons; and of malleable Bessemer and white and mottled pig iron, direct castings, ferrotitanium, etc., 3701 tons last year against 129 tons in 1912. The 1,000,000-ton mark in pig-iron output was crossed for the first time last year.

Two new blast furnaces were under construction at the close of 1913. Of the 22 completed furnaces 17 usually use coke for fuel and 5 use charcoal. Two new coke furnaces were added in 1913; one 20 x 85 ft., blown in May 22, belonging to the Dominion Iron & Steel Co., Sydney, N.S., and the other at Port Colborne, Ontario, 19½ x 85 ft., belonging to the Canadian Furnace Co., Buffalo. The Standard Iron Co., of Montreal, completed a charcoal furnace at Parry Sound last year. It is 12 x 60 ft. and was first blown in on August 22.

RECENT MOLDING MACHINE ACHIEVEMENTS.

A WESTERN manufacturer of molding machines is authority for the following interesting comparison of costs on several pieces of foundry work, as made up by hand and by machine.

The first job mentioned was a rub iron for wagons. This work had formerly been done by hand, 4 pieces on a gate. The average production was 70 molds per day, or a total of 280 pieces, at a cost of $3.30. The pattern for the machine was arranged to cast 6 pieces on a gate, and the production was increased by the use of the molding machine to 116 molds, or 696 pieces. The cost of producing the 696 pieces was only $3.48, or a total increase of 18 cents, for which an increase of 416 pieces was secured. This represents a reduction of nearly 60 per cent. in cost.

A second job was the molding of a small sprocket wheel, the production of which, on the bench, ran from 12 to 15 molds per day. This production was increased to 90 molds per day at a cost of 4c. per mold; each mold required the setting of 4 cores and 2 steel shafts.

A third instance was that of a door shoe, the average production of which was about 60 pieces per day on the bench. This job required the setting of 12 cores in each mold, but the daily production on a machine was so largely increased that it ran up to 260 pieces.

In the production of large sprockets and hand wheels for road scrapers, the use of a combined air squeezer and jolter machine increased the output from 15 molds per day, at a cost of 22c. per mold, to 70 molds per day, at a cost of about 6½c. per mold.

These records are of comparatively recent making, and go far to indicate that almost any foundry still offers a field in which the manufacturer may find opportunity for lowering his costs by the adaptation of his work to the proper type of molding machines.—Iron Age.

TRADE DISPUTES DURING MARCH.

A CONTINUED decrease in time losses through trade disputes was reported to the Department of Labor during March, as compared with the previous months of the year. The number of disputes was also considerably smaller than that of the corresponding month of last year.

Seven disputes resulting in time losses of 32,618 working days were in existence during March, as against fifteen disputes and 68,285 working days lost during the same month last year. The first three months of the present year have been very favorable from the standpoint of industrial disputes. Eight new disputes occurred in this period, resulting in time losses of 4,205 days.

During the corresponding period of last year twenty-one strikes were reported, the time losses resulting from these up to the end of March being 29,246 days.

Five hundred and thirty-seven employees have struck work or otherwise been involved in trade disputes during the first three months of 1914. This compares favorably with the corresponding period of 1913, when 4,511 workers were affected by strikes and lockouts.

Rail Production.— Rail productions and pig iron statistics for 1913 have been announced by the American Iron & Steel Institute. The output of all rails totaled 3,502,780 tons, an increase of 174,865 tons over 1912. In 1906 — the maximum—the aggregate was 3,977,887 tons. Open hearth rails more than doubled those of Bessemer manufacture; the former process showing an increase of 20 per cent., compared with 1912. Pig iron produced totaled 30,966,300 tons, an increase of 1,239,360 tons over the previous year. In Canada 1,015,118 long tons were made, an increase of 102,240 tons.

BLANKING, FORMING AND BENDING DIES.

By S. Craig.

THE accompanying cut Fig. I shows a simple form of compound die that could be easily fitted to almost any kind of a press. The punch part (3) consists of a blanking punch and a forming die (7), while the die contains the blanking die (4) and the forming punch (8). The stock is sheet brass .020 inch thick and is formed as shown at 1.

The tension pieces (BB) are of case-hardened machine steel and are kept flush with the top of the die by the pins (CC), the plate (F), and the supporting springs as shown. The piece (9) is also of machine steel and is fastened to the die with flat-headed screws. Its principal use is to hold the forming punch (8).

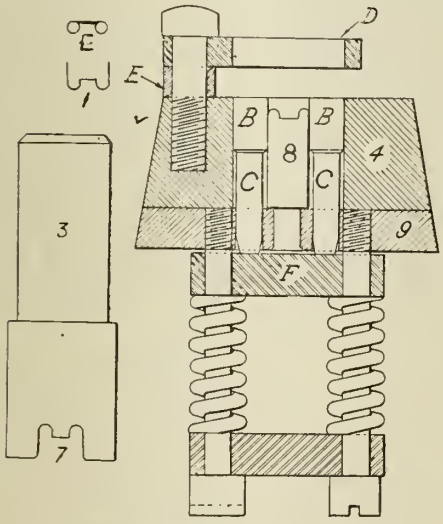

FIG. 1. BLANKING AND FORMING DIE.

A separator piece (E), supports the stripper (D) at the right height, and also acts as a guide to the stock. The blank is cut by the die (4) and the outer edges of the punch (3) which also forms the piece over the die (8). The tension pieces (BB) serve also as a stripper to remove the formed piece from the die.

Second Operation.

The second operation consists in wrapping the formed blank around the wires shown at (A) Fig. 2. This is accomplished by a simple curling die shown in the same figure and which explains itself. The two wires (GG) are laid in the grooves already formed in the brass blank and the whole is placed upon the die (5). The punch (6) curls the metal tightly around the pins forming the completed assembly (A). The above dies involve many principles of good practice and, with the addition of a few automatic feeding devices, could be economically used for the production of large quantities.

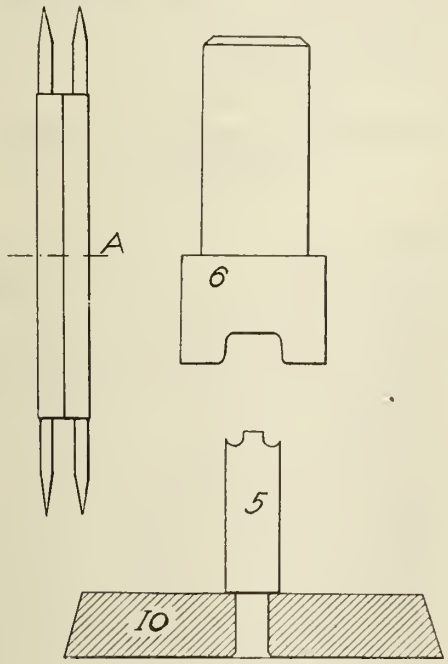

FIG. 2. DIE FOR CURLING OPERATION.

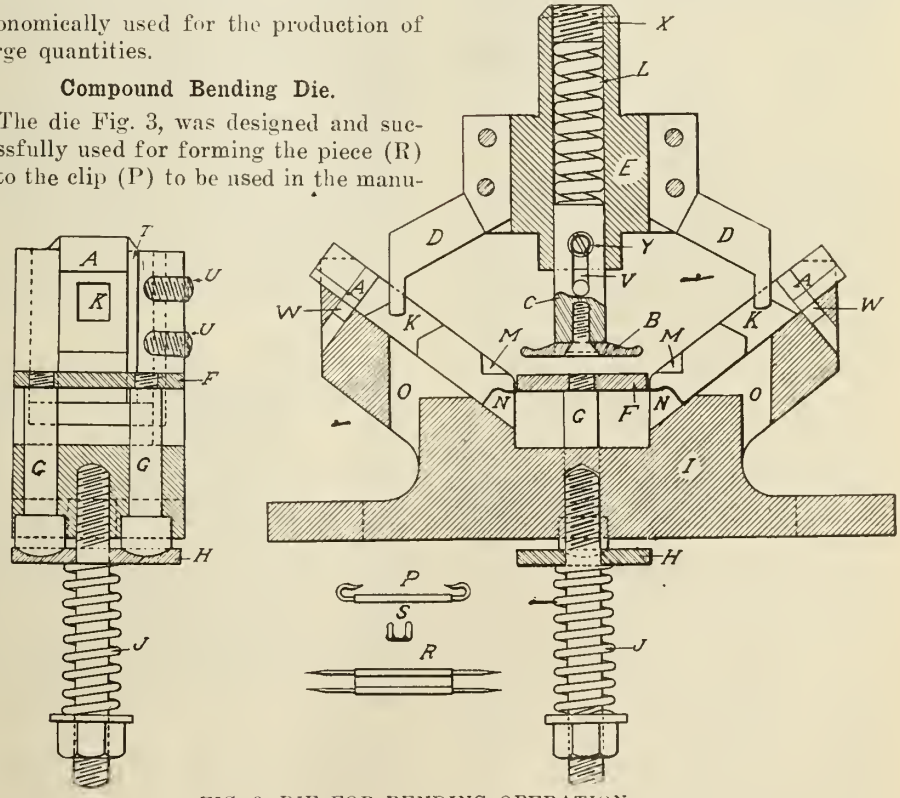
Compound Bending Die.

The die Fig. 3, was designed and successfully used for forming the piece (R) into the clip (P) to be used in the manufacture of ladies' belts. The body of the die (I) is made of cast iron. The machining on the sides and bottom was done in the shaper in the usual way. The beveled forming slides (AA) were cut at an angle of 37° with the base by means of a 60° end mill in the milling machine, and were made wide enough to allow for a one-eighth inch gib (J).

Two holes were bored and reamed for the two fillister head screws (GG) which support the plate (F). A hole is also bored and tapped for the stud as shown. The plate (H), supported by the spring (J) is countersunk to take the heads of the screws (GG). Both screws and plates are of machine steel and case-hardened. Two holes are drilled and clearance cut at (OO) for cams (DD). The slides (AA) are held in place by the grub screws (UU), and, at (KK), holes are worked at the necessary angle to slide nicely over the cam pieces (DD). At (NN) the slide is shaped to give the desired bend to the piece (P). The punch holder (E) is of machine steel turned, bored for the punch (C), and milled to fit the cam pieces (DD). These cam pieces are case-hardened and are held in place by four taper pins. A screw (Y) whose point fits in a slot in the punch, prevents it from turning round and misplacing the forming piece (B) which is fastened in a slot in the end of the punch.



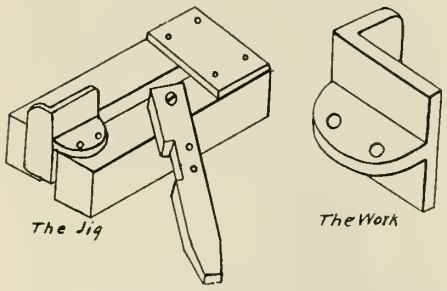


FIG. 3. DIE FOR BENDING OPERATION.

The piece (R) to be formed is placed on the plate (F) and located by the depressions (MM) in (AA). As F is depressed by the punch, the ends of (R) are bent up at right angles and when (F) bottoms and the spring (L) is compressed, the ends are bent to the proper form over the ends of the plate (B) by the parts (NN) of the rams (AA). As the punch is withdrawn, the rams (AA) are drawn away by the top sides of the cams (DD), and the formed piece is easily removed from the plate (B). No tool steel was used in the construction of this die, case-hardened machine steel being found to serve fully as well. All case-hardening was done with prussiate of potash, which in our experience gives the best results and is not nearly as poisonous as the cyanide of potassium.

THE JIG THE BLACKSMITH MADE.

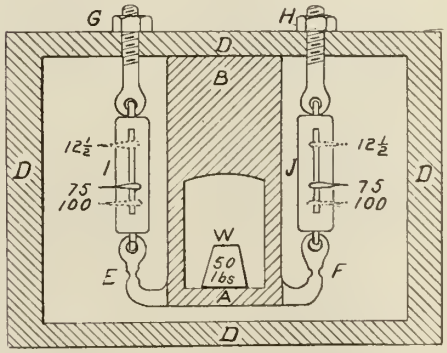
By D. A. Hampson.

WORK was not very brisk in the blacksmithing line and when our smith had dressed up the last lot of tools he approached me for another job. There was plenty to be done in the machine shop so I said, "There is a barrel of castings by that drill down in the south corner, I'll show you what to do with them. You see those depressions in the castings? Well, run a ¼-in. drill through all of them. There are also two holes of the same size to be drilled in the flange. I'll give you a templet, by which you can lay them out with a scriber and centre punch. If you can find a better way, go to it." With this, I left Johnson, well knowing that the job would get done without his being watched.

JIG THE BLACKSMITH MADE.

It was some time along in the next afternoon before I got round to where the castings were being drilled. I found all the "spotted" ones finished as well as a good share of the holes in the flanges. Johnson was surely working, but was he drilling to circles and punch marks? No sir. He had before him a quick loading, accurate and non-destructible jig of simple though wonderful design. Rough it was but it was doing its duty satisfactorily and what more was wanted?

The jig shown in the sketch was made almost entirely of scrap and is self-explanatory. It consists of two bars of iron fastened in the correct relation to each other by the plate as shown. The piece was located by the slot in the swinging handle by which it was also held in place. The guide holes were simply drilled in the handle and case-hardened. The whole fixture had taken little more than an hour to make and the old reliable Johnson worked away realizing only that he had saved himself considerable tedious work.



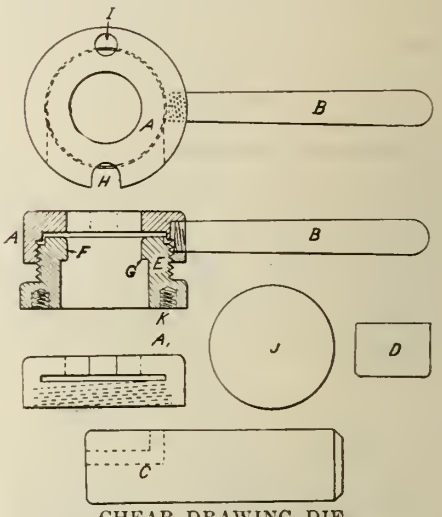
TENSION ON CYLINDER COVER STUDS.

By J. G. Smith.

I HAVE read with interest the debate on "Tension on Cylinder Cover Studs," and would be pleased to see such educational discussions come up oftener in your valuable journal. I give the following as my explanation and will be much gratified if you can find space to publish it.

Referring to the sketch (AB) is a tray, containing an aperture to hold the weight (W), and arranged to press against frame (D). Supporting arms (E) and (F) are so reduced that they will break under a load of 100 pounds. These connect to the frame (D) (D) through the spring balances and bolts as shown. The weight of the tray without the weight (W) is 25 pounds. Now, if the nuts (G) and (H) be screwed up until the pointers on the spring balances register 75 pounds each, the tray (B) will be forced against the frame (D) with a pressure of 75—12½=62½×2 or 125 pounds. Upon adding the weight (W), the indications on each scale will be 12½+6½+25=100 pounds, which is the breaking load of (E) and (F).

Supposing the pointer to have moved through a distance of 2½ inches when



TENSION ON CYLINDER COVER STUDS.

registering 75 pounds, the addition of the extra weight (W) will have caused (B) to recede from (D) one inch before the members (E) and (F) fail. This imaginary experiment proves to my mind that the theory advanced by Mr. Rogers is correct; that is, when steam or any other pressure is applied to a cylinder head, an immediate stress is put on the studs that support it.

CHEAP DRAWING DIE.

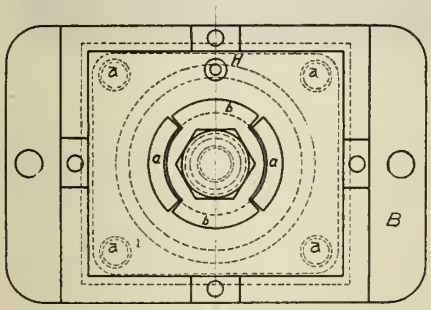
By S. Craig.

THE die herein described involves some principles that could be utilized for a multitude of small jobs in the shop of limited tool capacity. It was made for drawing the cup (D) from the blank (J) in one operation. The material was sheet copper about .020 inch thick. As there were not many of the cups required, the material used for the dies was machine steel and, after completion, the parts were case-hardened and mounted in a foot press.

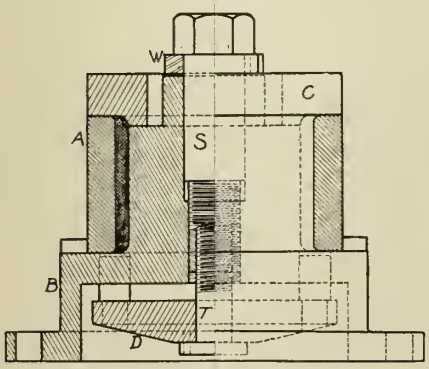
CHEAP DRAWING DIE.

The piece (E) or die proper was turned, bored, threaded and counterbored at one setting from stock of the right diameter. Two holes were drilled and tapped in the base (K) for the purpose of fastening the die to a bolster which was counterbored ¼ inch deep to receive it. The piece (A) or tension ring was turned up in the same way from the same bar of stock. The hole (I) is for the purpose of observing the position of the blank and the part H is cut away for convenience in pushing it in place through the slot, which is better shown at A. A hole was also drilled and tapped to receive the handle (B).

In operation, the blank (J) was pushed through the slot in (A) over the top of the die (E). The handle was then pulled towards the operator against a stop so adjusted as to give the required tension to prevent wrinkling of the material. The drawing operation was accomplished by the punch (C) and the stripping is automatically done upon the withdrawal of the punch by the edge of the counterbore shown at (G). The hole in (C) shown by the dotted



lines was drilled for admitting air and thus facilitating the stripping of the cup from the punch.



A BABBITTING FIXTURE.

By A. L. Loy.

THE fixture shown in the two accompanying cuts was designed for babbitting the malleable iron casting (A) which is used on the crank-shaft bearing of a gasoline engine. To distinguish it from parts of the fixture, the bearing is shown in section on both sides of the drawing. The base (B) of the fixture is turned to form the arbor about which the babbitt is poured, and also gives the fillet at the bottom. The top piece or cap (C) gives the fillet at the top and drops down over the central portion of the base (B), which does not quite extend through (C). The piece (C) is cut out, as shown at (aa), so that the lips (bb) of the washer (W) will drop through when turned around to correspond. As shown in the cut, these lips extend out over the cap and clamp it to the base (B).

The stud (S) is threaded at the lower end into the base, besides being tapped out for the screw (T), which is provided with a large head for holding the piece (D), being fastened solidly to the same to prevent turning. At the corners of the plate are the ¾-inch pins (dd) which extend up through the base near the corners of the piece to be babbitted.

BABBITTING FIXTURE.

A slight clearance is allowed between these pins and the casting when in the lowest position, in order to allow the washer to be released.

It will be noticed that the stud (S) is threaded into the base (B) with a left-hand thread of ⅛-inch pitch, and is tapped out for the screw (T) with a right-hand thread of the same pitch. After the piece (A) is babbitted, the stud (S) is turned slightly in a clockwise direction, thus loosening the washer (W), which is then turned so that the cap (C) may be lifted off. A further motion of the stud (S) in the same direction causes it not only to rise itself, but, due to the internal threads, to pull up the piece (D) at double the speed; the two threads acting in the same direction. The arbor is turned with a 1/32-inch taper, as these bearings are afterward bored to size. These pins lift the bearings about three-eighths of an inch on the arbor, sufficient so that it may be readily removed.

The casting (A) has previously been finished on all six sides, and is centered by steel pieces on the base. The babbitt is poured through the hole (H). This fixture is extremely quick-acting owing to the combination of the two screws, and is very simple in operation, as no trouble was experienced in getting these bearings off the arbor, enabling them to be turned out in a rapid and efficient manner.

BEARING SPLITTING AND BORING FIXTURES.

By D. S. Mann.

FIG. 1 shows a bearing used on a gasoline engine. It is a malleable iron casting with babbitt lining cast in. Two halves of the bearing are cast as one piece, and, after being babbitted and otherwise machined, are parted with ¼-in. milling cutter on either side. Shims are then used in this space to obtain the adjustment of the bearing. The casting is machined on all four sides and the end, but, as this is ordinary milling machine work, the fixtures used are not shown. The bearings are babbitted on a solid arbor, which is 1/32-in. small, and the bearings are then reamed or bored to size on the fixture shown in Fig. 2. This work is done in a radial drill press, the fixture being clamped on the edge of the table. The bearing is held between two shoulders at the side, and rests upon ½-in. pins at the bottom, while two ⅝-in. capstan screws hold the bearing in place, these being located in a cross-bar which drops over the necks of two 1⅛-in. steel posts. The bar is slotted large enough so that it can be readily picked off and dropped into position. A fixed bushing is placed at the bottom, while a removable bushing is used at the top, being located in another fixed bushing.

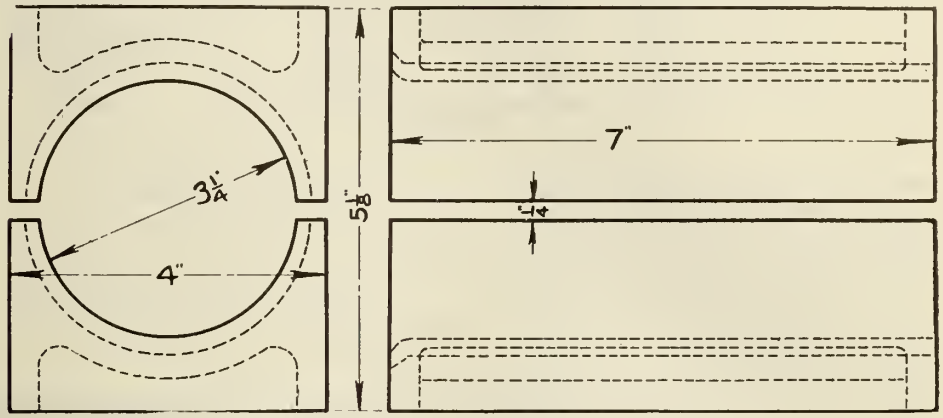


FIG. 1. BEARING SPLITTING AND BORING FIXTURE.

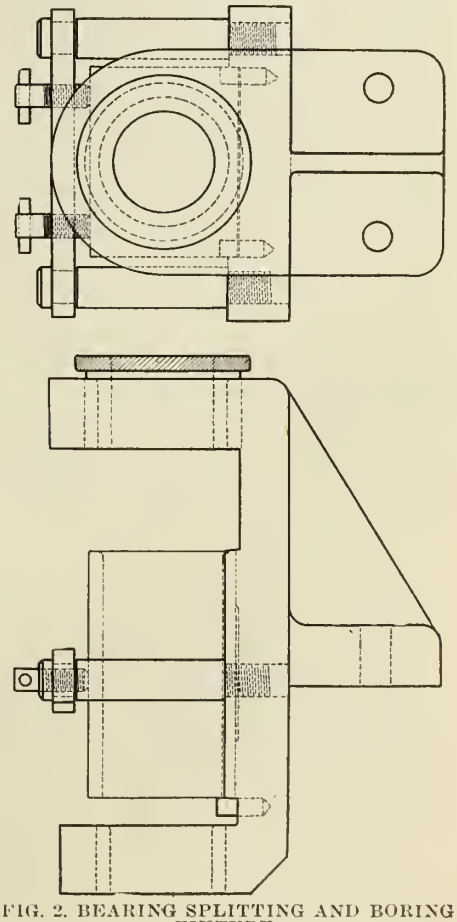

FIG. 2. BEARING SPLITTING AND BORING FIXTURE.

Perhaps the most interesting part is the boring bar shown in Fig. 3. This

bar is deeply grooved at the lower end, so that the babbitt chips do not interfere with its operation. The bar is 2¾ in. in diameter, and is slotted out for a steel block ⅝ in. thick, in which are located the two cutting blades, these being of high speed steel 5/16 in. thick and ½ in. wide. They are placed at an angle of 60 degrees to the axis of the bar, and are backed up by ⅜ in. adjusting screws. Each cutter is held in place by two hollow set screws through the bar itself. The steel block carrying the cutters extends out ⅛ in. on each side of the bar, this being sufficient to catch the removable bushing at the top.

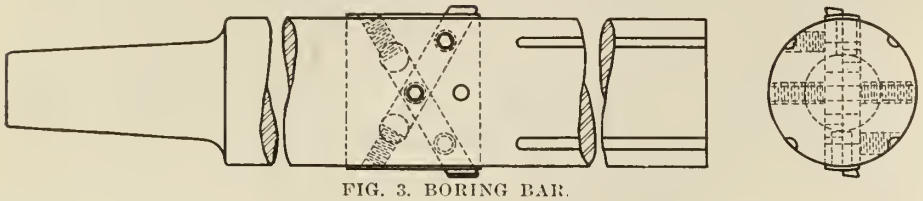

FIG. 3. BORING BAR.

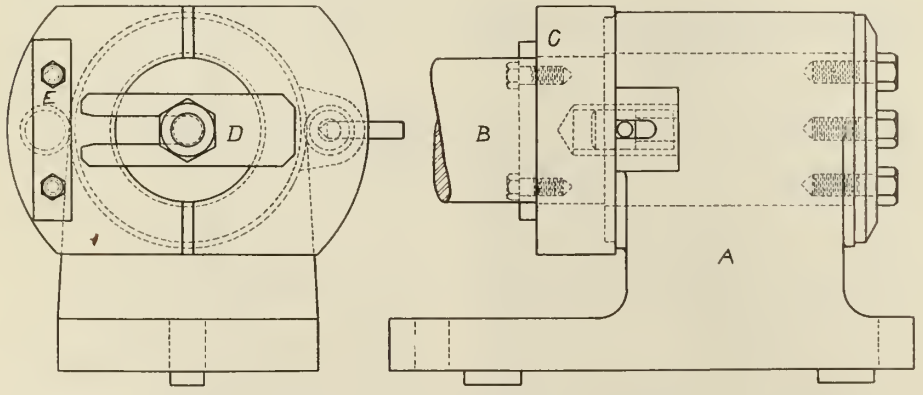
After one of the bearings is finished, the spindle of the press is simply raised and the removable bushing is caught on the projecting block in the bar and lifted out of the fixture. Holes are drilled through the steel block at the ends of the plate for the adjusting screws. After being bored, the bearings are split on the fixture shown in Fig. 4.

The body (A) of the fixture is bored out to receive the arbor (B), which extends through the body, being provided with a plate (C) at the one end, which also carries two bushings for indexing, and at the other end a steel plate held by cap screws. An index pin is located at the side of the body, and is operated by a small pin which is driven into the index pin. The index pin is fitted at the back with a heavy spring.

The plate (E) at the left side is for the purpose of squaring up the bushings automatically, so that it is only necessary to slip them on the arbor and drop the slotted clamp (D) across the end. The ¾-in. stud is placed in the end of the arbor, and the top and bottom of the threads are milled off to ⅝ in. thickness. The bar (D) is also slotted ⅝ in., so that it will not turn when slipped over the stud. A ¼ in. by 4 in. milling cutter was used for parting the bearing.



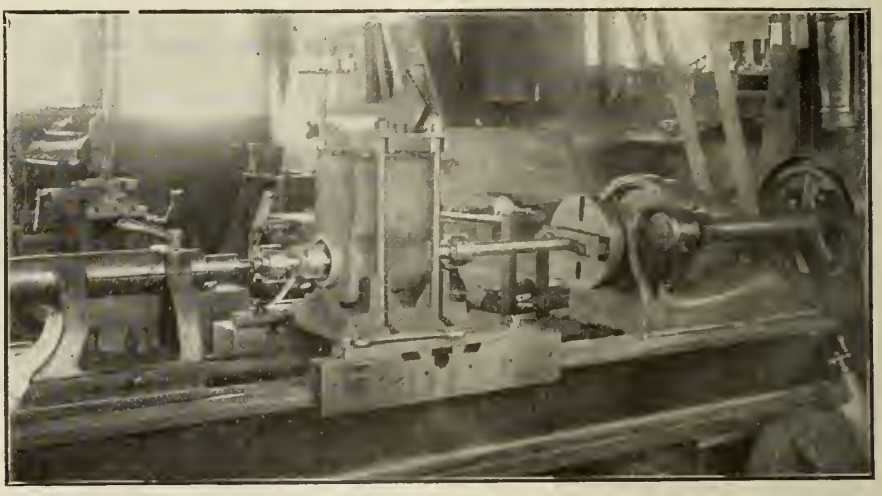


FIG. 4. BEARING SPLITTING FIXTURE.

BORING CYLINDERS.

By D. O. Barrett.

THE photo shows a method used in boring hopper-cooled gasoline engine cylinders. These particular cylinders ranged from 4 to 6-inch bore, in six sizes, there being three sizes per set; that is, 4, 4½ and 5-in. bore cylinders had the same outside dimensions, while the same was true with the 5, 5½ and 6-inch size. The two sets had, of course, a different stroke. Only two fixtures were then necessary for the six cylinders.

The cross slide was removed, and the fixture shown was clamped and doweled to the carriage. The vees of the fixture were supplied with hardened jaws on each side, while a shoulder at the end took the thrust, having an adjustable stop for locating. Four bolts were used for clamping, the top cross-bar being provided with a hinged piece, which touches the cylinder on either side, thus equalizing the pressure and minimizing any liability to distortion. A flat was milled on each side of the boring bar at the end, and was driven by the slotted bar attached to the face-plate. This equalized the driving strains, so that there was no tendency to bend the bar. Two roughing and one finishing cut was taken through the cylinders. The three cutter heads were placed on the bar at the head end in the order in which they were to be used, and were driven by means of a pin through them and the bar. None of the cutters were removed until the cylinder was entirely finished, when they were all at the other end of the bar. The blades were set at an angle of about seven degrees, and were held by taper pins, the bodies being of steel. After being bored, the cylinders were placed on a stub arbor and the ends faced.

BORING CYLINDERS.

Concrete Hardening Material. — A concrete hardening material now being introduced contains 95 per cent. iron dust or iron flour, which is mixed with cement for finishing the surface of concrete floors. From 15 lb. to 25 lb. of the material is mixed with 100 lb. of the cement while dry, and one part of this mixture to two parts of sand makes the slurry for the top coat, which varies from ½ in. to 1 in. in thickness. It is said to make a hard and durable floor, waterproof and not slippery. The hardening material is used also to make new concrete adhere to old concrete in repair work.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

Doubtless some of the elementary work in the first few articles of this series may appear more or less superfluous, but it must be remembered that numerous simple rules and formulae appear from time to time in Technical Journals, which are discarded and dubbed impractical by many operators for the simple reason that the elementals are either unknown or have been forgotten. The purpose of this course will have been achieved if the above tendency is even in part combatted.

GEOMETRY.

GEOMETRY is that branch of mathematics which treats of the properties of lines, angles, surfaces and volumes.

A point indicates position only; it has neither length, breadth nor thickness, while a line has only one dimension—length.

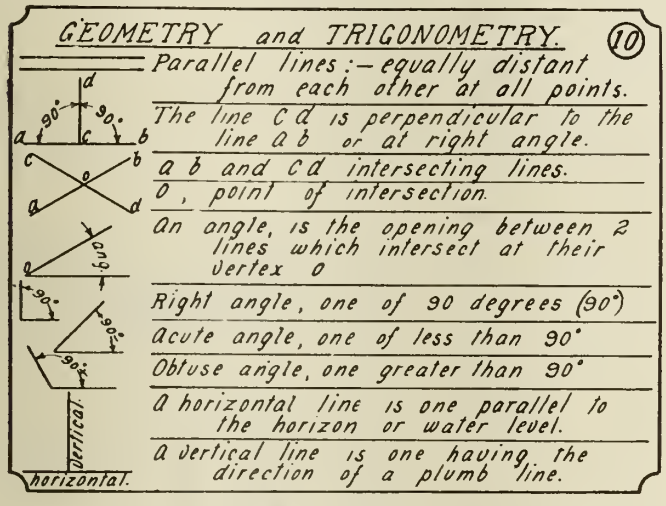
Parallel lines are equally distant from each other at all points, and a line is perpendicular to another when it meets it and forms two angles of 90 degrees each.

A horizontal line is one parallel to the horizon, or water level.

A vertical line is one having the direction of a plumb line, or is at right angles to the horizontal. Intersecting lines are those that cross each other.

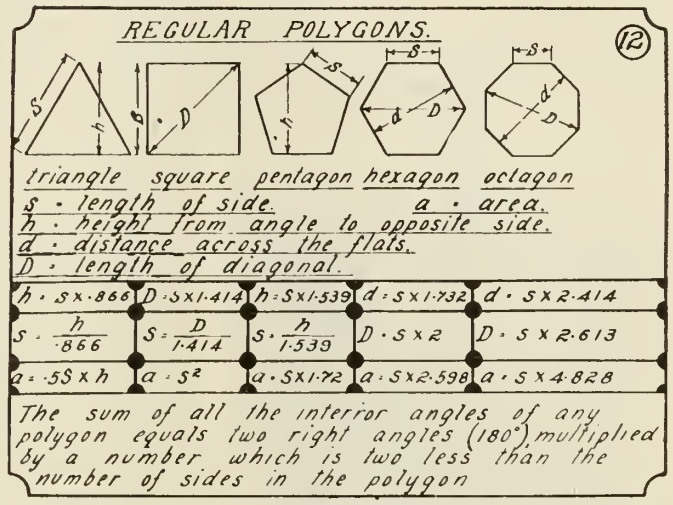
An angle is the opening between two lines that meet at the vertex of the angle. (See Chart 10).

When expressing an angle by the use of figures or letters, the vertex is always denoted by the middle letter, as (a.o.b.), (o) being the vertex of the angle.



A right angle is one of 90°.

An acute angle is one of less amount.



An obtuse angle is one exceeding 90°

When one line meets another and forms two adjacent angles, these two angles will equal two right angles.

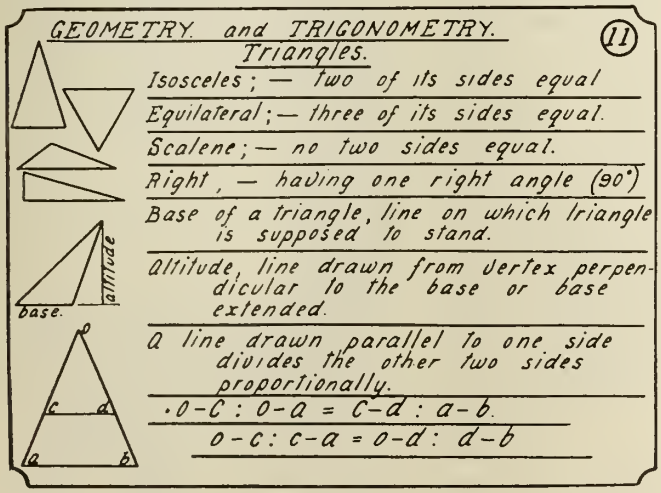
When one line crosses another and forms four adjacent angles, the sum of the four will equal four right angles.

ARITHMETIC CHART 10.

ARITHMETIC CHART 12.

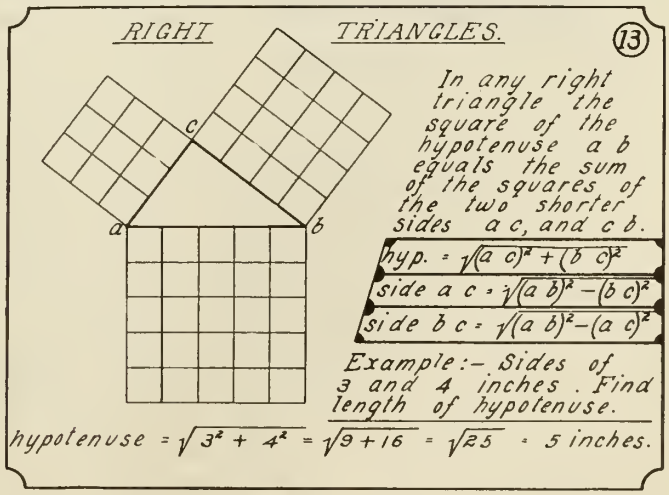
When one line crosses another and forms four adjacent angles, the sum of the four will equal four right angles.

A polygon is a plane figure inclosed by straight lines.



The perimeter is the sum of the bounding lines.

A regular polygon is one in which all the angles are equal, and all the sides are of equal length. Several regular polygons are shown in Chart 12.



The Triangle.

Triangles are of four kinds; isosceles, scalene, right angled and oblique angled.

An isosceles triangle is one with two of its sides equal, and when three of its sides are equal, it is called an equilateral triangle.

ARITHMETIC CHART 11.

ARITHMETIC CHART 13.

Plane Figures.

A plane figure is any part of a plane surface bounded by straight or curved lines.

A scalene triangle is one in which no two sides are of equal length. This also applies to an oblique triangle.

When one of the angles is a right

angled triangle the triangle is called a right triangle, and the side opposite the right angle is called the hypotenuse.

The altitude of a triangle is the perpendicular height from the vertex to the base or base extended. (See Chart 11).

The sum of the three angles of any triangle equals two right angles.

In any right angle triangle the square of the hpyotenuse equals the sum of the squares of the other two sides. (Chart 13).

Example: What is the length of diagonal of a square with 3 inch sides?

By formula, Chart 13, the diagonal or

$$\text{hypotenuse} = \sqrt{(ab)^2 + (bc)^2} = \sqrt{3^2 + 3^2} = \sqrt{9 + 9} = \sqrt{18} = 4.242 \text{ inches.}$$

A triangle, whose sides are proportionally the same as those shown on Chart 13, will form a right triangle, thus, sides of 3, 4 and 5 or 9, 12 and 15 etc., will form similar triangles, although varying in size.

To prove this, draw the straight line (ab), 15 inches long. From (a), as a centre, with radius of 9 inches describe an arc, and from (b), with radius of 12 inches, describe an arc intersecting the other arc at (c); then (acb) will be a right angle or 90°.

By figures, we have, from Chart 13,

$$\text{hypotenuse} = \sqrt{(ac)^2 + (bc)^2} = \sqrt{9^2 + 12^2} = \sqrt{81 + 144} = \sqrt{225} = 15 \text{ inches.}$$

$$\text{Again side } ac = \sqrt{15^2 - 12^2} = \sqrt{225 - 144} = \sqrt{81} = 9 \text{ inches, or side } bc = \sqrt{15^2 - 9^2} = \sqrt{225 - 81} = \sqrt{144} = 12 \text{ inches.}$$

FACTORY ACT AMENDMENTS.

INSPECTION of all boilers in use in Ontario, excepting those in private residences, is to be made compulsory in an amendment to the Factory Act introduced into the Legislature by Hon. James S. Duff last week. The present law provides for the inspection of all boilers used in factories, shops and office buildings at least once a year, but there appears to have been no inspection of boilers in hotels, schools, theatres and other public buildings. In the bill now presented, these boilers are put in the same position as the others.

The proposition for general inspection was first linked with the suggestion that the boilers be inspected by the province, but as half the boilers in the province are under private inspection, the boiler insurance companies would practically be forced out of business.

Several other amendments are to be made to the Act regarding the working hours of children. In canning factories the working hours for children are to be reduced from ten to eight, and the employment of boys under eighteen years of age on elevators is prohibited.

The Stationary Engineers Act is to be amended, bringing all men in charge of hoisting engines under the law, so that in future they will have to secure certificates as other stationary engineers have to do.

RESTORING PUBLIC CONFIDENCE.

MR. C. C. BALLANTYNE, vice-president of the Sherwin-Williams Paint Co., discussing the trade outlook a few days ago, said: "Conditions throughout Canada are gradually improving, and with a good crop I am of opinion that industrial conditions will soon be normal. I do not look for a boom, but an early continuance of good business on a sound basis.

"The paint business is a first-class barometer, inasumuch as paint is a luxury, and is not used unless other and more urgent needs are well looked after. The sales of this company and its subsidiaries for the month of March show a substantial increase over the same month in 1912, and on this account I feel that the worst has been passed and that a steady improvement is at work."

Asked regarding western business, Mr. Ballantyne stated that orders from there were in bigger volume than last year, and that sales showed a fair increase. This depression, he said, had taught the West a good lesson, and much of the old gambling spirit which had developed has now disappeared. Westerners realized this, and business from now on will be steadier and sounder. Retailers of the West have bought little of late, and will soon have to come into the market, which will naturally tend to stimulate the manufacturing centres. The blue ruin talk regarding the West, he went on to say, was without foundation, and conditions there also are perfectly sound.

Believing that lack of confidence is delaying greatly the returning of prosperity, the Sherwin-Williams Company has started "the new prosperity campaign," a movement designed to stimulate the company's own business, and Mr. Ballantyne said that if other large manufacturers would adopt the same method and talk confidence, conditions would quickly right themselves. The farmers of the country were never more prosperous, and retailers of the smaller centres are naturally in good condition.

"All that is needed," he went on to say, "is a little encouragement from the big concerns to renew the confidence of the general public, which is now lacking."

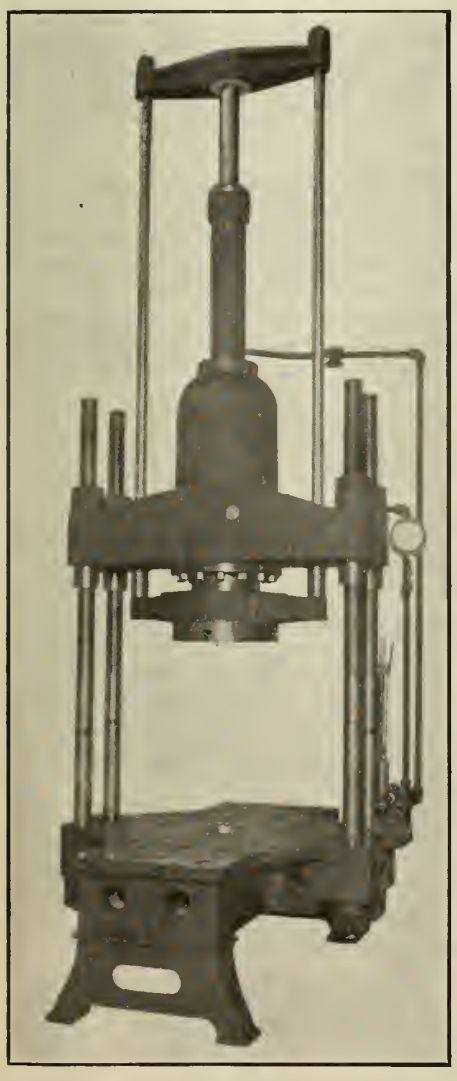
INTERNATIONAL ENGINEERING WORKS, LTD., REPORT.

IT has not been altogether easy sledding for the International Engineering Works, Ltd., during its first year of operation. This company, it will be recollected, is a reorganization of the Robb Engineering Co., which went into liquidation some twenty odd months ago. Reorganization was completed by the Corporation Agencies of Montreal about the 1st of March, 1913, and the financial statement recently presented to shareholders represents operations for the ten months ending December 31st, 1913.

The total volume of sales during 1913 amounted to $830,000; but after charging selling and managing expenses, the profits on the year's operations were only $12,590. The smallness of the profits was due largely to unremunerative contracts taken over from the old company, and to the general slackening in business during the last two months of the year. During November and December, and also during the first two months of the present year, business fell off very considerably, and earnings were not nearly up to expectations. The tide has now apparently turned, and it is reported that business is very substantially increasing. Orders on hand at boh factories at present exceed $100,000, and prospects are for a fairly profitable year. Various sweeping reductions have been made in management, selling and overhead factory expenses, and this will result in a larger profit, even if the present flow of orders be not maintained.

The balance sheet of the company shows fixed assets made up of real estate, buildings, plants, equipment, as appraised by the Canadian Appraisal Co., at the depreciated values of July 1st, 1912, together with costs of subsequent additions, of $802,000. The surplus of current assets over current liabilities amounts to $339,000. Profits from operations, as stated above, is before payment of bond interest.

The old board of directors was re-elected with one exception. It consists of Messrs. C. H. Cahan, K.C., president; H. A. Lovett, K.C., vice-president: C. H. Cahan, jun.; D. W. Robb, G. W. Cole and R. Binkley. Mr. G. W. Cole, the present acting general manager of the company, was elected to the board of directors, in the place of Mr. R. Garret, the former manager, who has resigned.



DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HYDRAULIC STRUCTURAL STEEL AND BAR STRAIGHTENING PRESS.

OUR illustration shows a new design of hydraulic press recently built by the Hydraulic Press Manufacturing Co., Mount Gilead, Ohio. Although orginally intended for straightening structural steel, bars and shafts, it can be used for a wide range of work in machine shop service, such as bending, forcing, forming, broaching, etc.

The daylight or stock space of this press has a variation of 28 inches—20 inches minimum and 48 inches maximum. The strain rods are threaded on their upper ends to one-third of their length, and are provided with nuts adjusted to both upper and lower sides of the cylinder bearings. When it is wanted to increase the daylight space, a block or some other suitable material is placed between the ram and pressure bed. The upper nuts are then set, and the pressure applied. This action raises the cylinder to these nuts. When the work is of such character that it requires a smaller daylight or working space, the block is still kept between the ram and pressure bed, the lower nuts being adjusted to the point desired, while the pressure is still applied. The pressure is then released, thereby taking the strain off the upper nuts, and lowering the cylinder accordingly. The upper nuts are then adjusted to place. To permit the raising and lowering of the cylinder the pipe connections are provided with swing joints.

HYDRAULIC STRUCTURAL STEEL AND BAR STRAIGHTENING PRESS.

Tee slots are provided in both the ram head and press bed for attaching bending blocks, forms or dies. The press bed permits maximum centres of 72 inches for bending. The long press bed also permits the use of an overhead crane in placing structural steel and other heavy material on it. The press bed is constructed with a hole in its centre, permitting the press to be used for broaching work and for forcing wheels on and off shafts, axles, etc. The pressure capacity of this press is 250 tons. The diameter of the ram head is 20 inches, and the run of ram is also 20 inches. The length of the press bed over all is 72 inches, while the width of working space is 26 inches. Steel is used throughout in the construction.

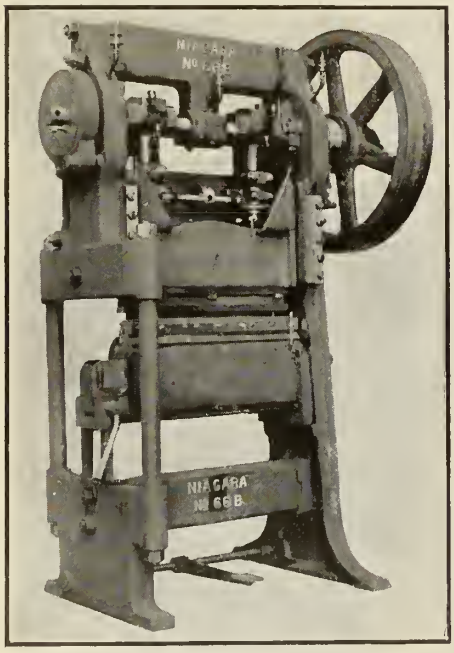
The four-way poppet operating valve used in operating this press applies the pressure to either the main pressure ram or the return ram working in the pull-back cylinder, and at the same time permits the water or oil used in operating the press to return to the pump reservoir from the cylinder on which the pressure is released. This valve is operated by a single lever with three positions:—1st—Pressure on main pressure ram and release on return ram. 2nd—Pressure on retur nram and release on main ram. 3d—Neutral position, holding pressure with the rams at any point in their travel in a stationary position. A five-way high and low pressure, double-acting, balanced poppet operating valve is furnished when desired.

Smile at the world and you get a smile back; give it a scowl and it will shake its fist under your nose; treat it with indifference or neglect, and it will forget that you live.

BALL BEARING DRY GRINDER.

THIS machine is a product of the Springfield Mfg. Co., of Bridgeport, Conn., and is made to meet the most severe duties that modern grinders are subjected to under continuous service with the least power consumption. The ball bearings used are of high class annular type and are amply large to carry many times the load that these bearings would ordinarily be called upon to sustain.

The outer bearing case, or box, is specially designed for grinder service, bing made with two felt packing rings on each side of the bearing. In addition to this end shells fit closely to the shaft, making it practically impossible for any direct or dust to reach the ball bearings proper. The bearings are filled with high grade lubricant sufficient to run for a considerable length of time. The makers have operated these machines under a test of three months' continuous run which, it is claimed produced no appreciable signs of wear on the bearings. When desired, the machines are furnished with a special type of hood for encasing the wheels. These are made to enclose the wheel completely with the exception of the space necessary for grinding purposes and, for changing the wheels the end cover is made easily removable as shown. The hoods are made with or without exhaust connections.



BALL-BEARING DRY GRINDER.

The strong point of these grinders is of course, easy running, and it is claimed that the power saved will, in a very short time, pay for the investment.

NIAGARA SIDE SEAMING MACHINE.

FIG. 1 shows a side seaming machine which constitutes a recent product of the Niagara Machine & Tool Works, Buffalo, N.Y. This machine is intended for use in forming the longitudinal seam in sheet metal used in the manufacture of oil and asphalt barrels, ash cans and similar products.

Fig. 2 shows in diagrammatical form the ends of two pieces of sheet metal before and after making the lock seam. This seam is formed by two consecutive strokes of the machine. Aside from forming the body, no preliminary work is required. The motion of the machine is controlled by a positive clutch, and the horn has a swinging support on its outer end to provide for entering and removing the work. A safety lock is

NIAGARA SIDE-SEAMING PRESS.

provided which makes it impossible to trip the clutch before the horn support is in the proper position. This machine has a capacity for work ranging from 9 to 24 inches in diameter, and up to 36 inches in length. Sheet metal up to No. 24 gauge can be handled.

CAR COMPANIES' OUTLOOK.

THE Canadian Car & Foundry Co., has orders on its books for passenger cars sufficient to keep its passenger department operating at full capacity for the next seven or eight months. Car parts, wheels, and accessories used in repairing rolling stock are also in demand; and the shops of manufacturers of this class of goods have been fairly well occupied and will be busy in the future.

Orders for freight cars up to date are disappointing. The Canadian Car and Foundry Co. has sufficient orders for them on hand to keep its plants in operation at present low capacity for the next two months, before the expiration of which period it is more than likely

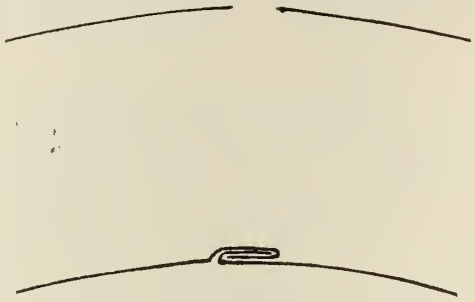


FIG. 2. BEFORE AND AFTER FORMING LOCK SEAM.

that large orders will be received from the Canadian railways. This department is only operating at about fifty per cent. of its total capacity, and if the plant were pushed, orders on hand could be turned out in about thirty-five days; but pending receipt of further orders, the plant will be kept operating at present rate for at least the next two months.

The Grand Trunk Pacific, the C.N.R., and the Intercolonial Railway, it is well known, are in pressing need of rolling stock. The financing of the Canadian Northern will mean that there will be money available for new rolling stock, and that road, it is estimated by car supply men will need 250 passenger cars and 10,000 freight cars, and it is reasonable to expect that Canadian car makers will get their share of this. As freight cars cost from $1,100 to $1,500, passenger cars from $16,000 to $20,000, dining and sleeping cars about $28,000, even a small portion of the C.N.R. order would mean a great deal to Canadian car manufacturers.

Grand Trunk equipment orders have been held up, owing to partisan squabbling at Ottawa, but the new equipment financing is said to be once more well under way and it cannot be long before the National Transcontinental will be ordering its rolling stock, which will mean an expenditure of more than $10,000,000.

The Intercolonial is also said to be in need of a great deal of new rolling stock.

All these are real urgent requirements of Canadian railways, and postponement cannot be made for very much longer of orders for at least a part of this equipment, even a small part of which would successfully tide the car manufacturers over their worst period of dullness. Although the Canadian Car & Foundry Co. can if necessary wait two months and keep its plant operating for that time without any more orders, it is unlikely that it will have to do this, as the railways will undoubtedly have to tap the market at an earlier date.

The Canadian Pacific Railway, owing to its heavy purchase of cars last year from car builders in the United States as well as in Canada, will not be much in the market for new rolling stock this year, but the other railways will more than make up for this deficiency.

CANADIAN PIG IRON IN UNITED STATES.

A RECENT issue of the Iron Age makes the following suggestive comments relative to the export and disposal of Canadian made pig iron in the United States:

The new cross currents which the reductions in iron and steel tariffs will introduce in American foreign trade statistics are illustrated by the impending increase in pig iron imports from Canada. Should the shipments of Dominion Iron & Steel Company pig iron to the United States this year be only the 20,000 tons already sold to New England and Delaware River foundries, the 1914 total will be several times the average import from Canada in recent years. At 1976 tons in 1908, with slight increases in the interim, the total being 4609 tons in 1913, Canadian pig iron shipments have been generally reckoned as principally electrolytic ferrosilicon produced at Welland. The shipment of Nova Scotia pig iron into the United States is especially noteworthy in view of the heavy exports of pig iron from this side of the line into Canada, chiefly to Ontario, these reaching 193,396 tons in 1913 and being at a maximum of 208,581 tons in 1912, as against only 44,758 tons in 1909. The large figures for 1912 and 1913 tell of the boom across the border that has now given way to marked recession.

That foundry pig iron shipments should be going in both directions between Canada and the United States, as at present, is not only a result of the new tariff, but a phenomenon of the far-extended territorial contracts of the two countries. Even with Canada's duty of $2.50 on pig iron, Buffalo district furnaces command a trade of 200,000 tons there as against the Nova Scotia furnaces now invading our Eastern seaboard.

It should not be overlooked that the appearance of Dominion pig iron in our Eastern markets is really one of the signals of the distress under which Canadian industries are laboring lately, in common with our own. Normally the Dominion Iron & Steel Company's pig iron is all needed by its steel works and it is a most exceptional condition that prompts the marketing by the company of anything but semi-finished or finished steel.

INDUSTRIAL NOTABILITIES--No. 29

PAUL JUDSON MYLER was born at Pittsburgh, Pa., April 24, 1869, a son of Thomas T. (a dry goods merchant), and Caroline C. (Mackay), Myler. The paternal ancestors were of Irish, and the maternal of Scottish nationality. His education was obtained in the public schools of his native city, and culminated in his graduating from the Pittsburgh Central High School in 1884.

His first occupation thereafter was that of bookkeeper in a produce commission house, following which he entered the employ of the Westinghouse Air Brake Co. in 1886, as bill clerk.

In 1896 Mr. Myler moved to Canada as secretary of the Canadian Westinghouse Air Brake Co., and in 1903 he was made vice-president of the Canadian Westinghouse Co., Ltd., which was formed to take charge of all the Westinghouse interests in Canada.

PAUL J. MYLER.

Mr. Myler is president of the Hamilton, Waterloo & Guelph Railway Co. and a director in The Travellers Life Insurance Co. of Canada.

Among the clubs, he is chairman of the Board of Governors of the Hamilton Club, and a member of the following:—The St. James' Club of Montreal, the Duquesne Club of Pittsburgh, Pa., the Lawyers', Engineers' and the Transportation Clubs of New York City; the Thistle, the Hamilton Golf, the Royal Hamilton Yacht and the Hamilton Jockey Clubs of Hamilton.

He is also a member of various Railway and Technical Clubs and Associations in Canada and the United States.

Mr. Myler was married October 26th, 1898, at Hamilton, to Lily Maude Lottridge, a daughter of Mr. J. M. Lottridge.

SAFETY FOR CITIZENS.

FROM the State of Washington, we hear of the newest and withal one of the sanest campaigns for the protection of citizens from injury due to carelessness of their own or of others. At the request of Governor Lister, the Industrial Insurance Commission and the State Labor Department have conferred, with the result that safety committees of workmen are being organized in all parts of the State. These committees will each consist of three men whose duty it will be to receive reports from other workers as to dangerous conditions of surroundings or machines, and to carelessness on the part of other workmen as well as to do safety work on their own initiative.

Here we see a safety campaign instituted, not by manufacturers and contractors driven to it by legislation for workmen's compensation for injuries, but by the workers themselves, backed up by the highest Federal authority. That these committees will be earnest, enthusiastic and thorough, if unhampered in their work, goes without saying, and we can rest assured that the work will be well done, yet without the cost of the installing of more or less superfluous safety appliances as is often the case.

Statistics of the Industrial Insurance Commission point out that less than three per cent. of accidents are due to unsafe machinery. With the responsibility for permitting carelessness, the great cause of accidents, placed upon the shoulders of the workmen themselves, we expect to see them much better looked after by each other than was possible when this responsibility rested entirely with the employers.

THE COLLEGE ENGINEER.

THE time is almost with us, when the universities will add their annual contribution of young manhood to the commercial and industrial world. This event seems to be no great source of pleasant anticipation to a great many of our managers and superintendents who inevitably become acquainted with these embryo engineers sooner or later.

"You say you want a position. What kind of a position?" "A position as assistant superintendent or foreman, I should say, sir." "Yes, what experience have you had along that line?" "Very little, sir. I am a university graduate with honors." "Can you tell an industrious and loyal man from a natural born loafer, and can you keep men constantly up to their work and hold their good will at the same time?" "Probably a position as inspector would suit me better." "Can you line up an engine or could you pick out the loose rivets in a boiler or a girder?" "N—no, but I could soon learn that. I certainly could fill the position of a chief draughtsman." "Do you think you could write up a specification that would give us all the rope possible and still look good to the other fellow?"

If the prospective employer be himself a graduate of the school of hard knocks, or if he be an energetic disciple of the doctrines of R. T. Crane and others, we can look for little consideration on his part for the ambitious applicant. The conversation usually ends with a more favorable aspirant being offered a trial as a junior draughtsman or as an apprentice in the machine shop, the latter generally being declined with more or less affronted dignity.

The greater proportion of our employers are much more kindly, even though they sternly follow the path of business expediency. The men whose success has been and working them advisedly for the best that is in them, and working them advisedly for the best that is in them, can often see in this raw material some finished essential element to a successful organization.

The university man is often the victim of parents who are imbued with the idea that, by some mystic means, a great centre of learning can so mold their son as to pro-

duce, at once, a master mechanical and organizing mind. He is sometimes the offspring of wealthy parents who are moved almost solely by a romantic interest in the mysterious and potent word "engineer."

Under our present system of educational segregation, the student's first experiences upon entering the world of work and achievement is fraught with many disappointments. He has attained "something," and even though he can find no direct use for it, he cannot help but feel that it places him in a class above those who have it not. His apparent assumption is often the outcome of a personal sense of ignorance of things that are common knowledge to those whom he has been wont or taught to consider his natural subordinates. "Who's the new gaffer, John?" "Oh, he's one o' those stuck-up college guys what don't know nothin'."

The difficulties of the thorough mechanic who succeeds in getting for himself a college training are very little less at the beginning, for he finds hundreds of technical men working for a much smaller remuneration than he received as a daily wage. He finds that executive and organizing ability or the power of focusing different minds harmoniously to a common achievement is more in demand than great scholarly accomplishments.

The employer has found in the product of our educational institutions, a very incomplete and unbalanced cog to apply to the wheels of industry. He finds it necessary to invest in these men a great deal of tedious and expensive training at the end of which his engineer is a very uncertain quantity when offered inducements by others.

At the present time, there is little harmony and cooperation between our colleges of learning and our centres of industry, but we fondly look forward to such a coordination of these necessarily allied interests that the youth of suitable natural endowments can, without the assistance of his father's purse or social position, and with his own energy and personal worth, obtain a training that will enable him to take the reins of production without humiliation to himself, the envious dislike of those under him or the bringing of disappointment and chagrin to his superiors.

TARIFF REVISION.

AS we go to press, the details of the Budget speech of the Hon. W. T. White, Minister of Finance of the Dominion Government, come to hand.

Limiting ourselves on this occasion to a few observations only, there is evidence that in a general way manufacturers have been given the bulk of the favors, and as a consequence a moderate revision upward of the tariff is the real and ultimate effect. It is unnecessary perhaps for us to say that a more or less widespread dissatisfaction will be voiced by the agricultural section of our population, and as a result a decided lessening of that community of interest that should exist between East and West.

As in most countries, there exist two sharply defined opposing classes, separate from politics, except in so far as that feature can be made a tool in their hands; so in Canada also there is to be found a like condition prevailing. We have, largely due to our territorial expanse and natural development, the manufacturer on the one hand and the farmer on the other, each ostensibly working for the welfare and development of our Dominion, but actually, on every occasion and by every known means, and the latter perhaps not always strictly within the moral law or that of common decency, working for himself. Our manhood and national progress is being sapped by the canker of individual selfishness and personal gain, so much so that no other consideration, but that of getting the better of the opposing interest, is ever apparent.

We are a young country, but growing and developing rapidly. In the upbuilding of our industries and manufactures we of necessity had and have to protect ourselves, but it is surely no sign of growing strength in our manhood and skill, if the props, one by one, be not removed as time goes on. Our farmers in the matter of selfishness and quest of personal gain are not a whit behind our manufacturers, yet it cannot be gainsaid that much as the prosperity of our country is dependent upon the results of their labors, their influence is not as potent when it comes to swaying a government to make concessions for them.

If the welfare of this Dominion and the adjustment of matters on which our East and West are so much at odds were handled by representative men on each side, periodically and thoughtfully, and if the detestable political feature were eliminated, there would be less unrest in every sphere of our national life, less crime, less poverty, and a higher staging of our country in the estimation of other nations.

SOME PHASES OF SCIENTIFIC MANAGEMENT.

THE study of scientific management was begun by Mr. W. F. Taylor about thirty years ago and the results of his researches were presented to the public in June, 1903. In a very few years he had a large number of followers, his theories being enthusiastically received by many, and his writings directing the thoughts of some deep-thinking men along these and similar lines. The attitude of the operatives in many factories at that time was giving their management no small concern, so that many employers were more or less ready to adopt any system of government for their plants that would seem to be a solution of the great and growing problem of labor unrest. "Scientific Management" deals primarily with the workman, and, if necessary, subverts the rest of the organization to his necessities.

The principle and most successful modification is the "Emerson" system which differs from that of Mr. Taylor in that the systems in use are simply supplemented by the addition of enough specially trained men to carry out the calculations and to do the work peculiar to the new system. This arrangement has, so far, been the most used, and has been an unqualified success in many institutions, particularly in the United States; and its failures, in most cases, have been attributable to easily discernible causes. Strange to say, its most important feature, the accurate standardization of work by the study of work elements is the most neglected part of the system. This science is more or less mystifying to financial and business men, and they have been loath to delegate it to technically and mechanically trained men. The work of its inauguration has been largely intrusted to office clerks and to contract estimators, with no consideration of the natural antipathy of the workmen towards these men.

The operative must be taught how to use most economically the machine under his charge. He must be made to overcome the greatest obstacle to the plan on his part, the habit of doing things wrongly and in the wrong order. This necessitates an efficient demonstrator.

It has been found that the general inaccuracy of work has in some cases, been a serious obstacle to the successful adoption of Scientific Management. The proper calculation of the extra work caused by ill-fitting parts is not only the most difficult for the specialist, but the work itself possesses the smallest element of profit. One of the first essentials to the success of the new system, therefore, is the perfection of mechanical operations and processes in vogue with the old system.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

THE BUSINESS OUTLOOK.

AS spring approaches there is an evident tendency towards greater confidence; but facts, such as generally guide business men, are of a character that compel caution. March bank clearings, for instance, indicate beyond doubt that trade decline is still in progress. Railroad earnings are also equally definite on that point. Foreign trade decline has not yet been arrested, according to press reports from Ottawa, although export trade will be affected somewhat by the decline in food prices in Britain.

The Political Factor.

There is also for the time being a very depressing factor in the political situation. Whatever the Finance Minister announces will be welcomed, as it will remove from the outlook an element of uncertainty. If no aid is given to steel manufacturers they will accommodate themselves to conditions, and if their wishes are met, they will do likewise, but with more heart. They will also be cheered by the prospect of a settlement of the railway outlook. Premier Borden has intimated that the railway situation will be met, which is cheerful news. What is next needed is settled conditions.

Our Neighbors.

Those who have hopes of sharing prosperity with the United States are apparently doomed to some disappointment. The bankers there have made up their minds that the important questions now confronting that country must be settled before business can attain to anything like activity. The railroad question there is just as acute as that of Canada, and business generally appears to have settled down to quiescence until it is settled. There are indications that some decision may be reached by the beginning of May.

As in the United States, so in Canada, there is some hope in the fact that the common people are beginning to understand how closely business conditions are associated with the welfare of the leading enterprises of a nation, among the greatest of which are the railways.

Money.

Advices from London indicate that borrowing there during the first three months of the year is on a scale that has not been reached since 1910, and the record of that year has approximately been reached. Nevertheless there appears to be still considerable money available there for investment, as indicated by the satisfactory reception given to recent Canadian issues. This is a good sign.

A New York banker says that public sentiment once energized in a given direction gathers force as it proceeds, and with regard to certain public questions in Canada, sentiment is being energized, and will, no doubt, have its effect. With big political business questions uppermost in the public mind no great change can be expected, but meanwhile factories and business houses are being put in order, and when once business is energized, we believe it will gather some force, even as early as the next few months.

Montreal, Que., April 6, 1914.—Readers should note that the Montreal prices for English and Scotch pig iron, given this week on the opposite page, are prices "on dock, Montreal," at the opening of navigation. For loading into cars the charge is 40 cents per ton extra. These quotations are the lowest obtainable for car-load lots, and some dealers are asking even higher prices. For instance, the price of Middlesboro, No. 3, varies from $17.75 to $18.25, and intending buyers should bear this fact in mind. Very few inquiries are being received as yet for first half delivery, and it is a long time since the pig iron market was as dull as it has been during the past few weeks. The demand for copper, tin, lead, etc., is also very dull.

The directors of the Montreal Arena have now definitely decided to install an artificial ice plant at their skating rink, and it is to be ready for operation next Fall. Tenders for the refrigerating machinery and equipment will be invited just as soon as the plans have been got out; but it is too early yet to say whether the machinery will be steam or motor-driven. The plant will be thoroughly modern, and will probably necessitate an outlay of from $60,000 to $80,000.

The Montreal Board of Trade are still urging the Government at Ottawa to do something to improve the pilotage conditions on the St. Lawrence. They have recently renewed their petition to the Minister of Marine and Fisheries asking for special legislation, which will provide for the abolition of the Quebec Corporation of Pilots and put pilots under the control of the Minister of Marine and Fisheries, so that conditions may in future be the same below Quebec as above it. The appointment is urged of a superintendent of seagoing experience, who is neither a pilot nor an ex-pilot, to have full charge of the district above and below Quebec. It is understood that the Hon. J. D. Hazen intends to put through special legislation in time to be effective for the approaching season of navigation.

The snow is rapidly disappearing, and in a few weeks from now a great increase in activity in the building trade is looked for. A large number of residences will be erected, but only two large office buildings are at present spoken of. One of these is the rebuilding of the Bank of Toronto at the corner of St. James and McGill Streets, and the other is the Marcial Trust Building on the site of the old Herald Building on Victoria Square. Large office buildings have been put up in such numbers during the last year or two that the demand for space has slackened off considerably; in fact, tenants are able to pick and choose their accommodation just now pretty much as they like—a very different state of affairs to that existing three or four years ago.

Toronto, Ont., April 7, 1914.—Any marked improvement in trade generally is still a negligible quantity. It was to have been expected that with the advancement of the season business conditions would have assumed a brighter aspect. This expectation will, however, be delayed in its fulfilment until a greater degree of confidence is exhibited by manufacturers and financial concerns. The budget announcement, which has been anticipated with interest, indicates a desire on the part of the Dominion Government to assist the steel industry. The tariff has been increased in a few cases, the most important being the addition of a duty on wire rods, which were previously on the free list, but are now subject to a tariff of $2.25 to $3.50 per ton. Seamless steel tubing and rolled steel angles, shapes, etc., are included in the list of articles subject to an increase of duty, although, in the latter case, the increase is insignificant. The publication of the tariff should have the effect of clearing the air and result in a more settled condition in business circles generally.

Dull, or its equivalent, is the only word that can be used in expressing an opinion as to the present condition of the steel market. As anticipated in our report of last week, prices for this quarter have not advanced over those of the preceding period, and the volume of business is still light. The mills are still endeavoring to keep prices up, but it remains to be seen how far they will be successful in doing this, in view of the light specifications being sent out by consumers. There is a probability that a slight reduction will be made in some lines. We understand that the Canadian Vickers Company have sent out an inquiry for 3,000 to 4,000 tons of plates and shapes for the icebreaker which they will build.

Little can be said regarding the state of the market for pig iron; prices are stationary, and the tonnage is light. It is probable that if any change in prices takes place it will be in an upward direction; at present, however, business is very quiet.

Dealers in machine tools report business as being quiet, with few specifications on hand. The activity noticeable early in March has not been maintained. During that period a number of inquiries were sent out, but buyers appear to be holding back until trade generally shows more definite signs of improvement. The locomotive and car building plants are quiet on account of the railroads holding back orders for equipment. The situation in this respect may be relieved as soon as the Dominion Government have announced their decision regarding the negotiations pending.

The general situation in the metal market is unchanged, business being inclined to be dull, although orders are now being received for somewhat larger quantities than for some time past. Copper is stronger, but other metals show the same weakness as exhibited during the past few weeks.

Winnipeg, April 4, 1914.—Business in machine tools shows considerable improvement on last week. Several big orders have been filled, and a large volume of inquiries have been received, mainly from small machine shops and garages, their requirements averaging around $1,000 to $2,000. If things materialize as some of the brokers here expect them to do, some good business should be written up during the coming week. The supply business has been unusually good, the demand being mainly for twist drills, grinding wheels, transmission equipment, etc.

While the railways on the whole in the West have expressed their determination not to buy machine tool equipment just now, the C. P. R. is this week in the market for two separate lots for coal handling plants at Fort William and Winnipeg. Their specifications are for an 11-inch lathe, a 26 x 48 gap lathe, a 36-inch drill, a 24-inch shaper, one power hack saw, a grindstone and frame, pressure blower, stationary forge, an emery grinder, one 10-h.p. electric motor and considerable transmission equipment. Most of the machine tool brokers in the West are figuring on this order.

The City of Calgary, who were in the market for a considerable number of iron and wood-working tools, for some reason or other cut their order in two, which was distributed over a large number of brokers. The Alberta Rolling Mills, who have operated a rolling mill in Medicine Hat for two years, recently added a bolt and nut department to their business. The order for the machinery equipment has been placed with the Stuart Machinery Co., Winnipeg, and amounts to over $10,000. This firm will shortly be in a position to supply demands in Western Canada for nuts and bolts. J. L. Pollock is the president.

It was stated recently that Henry Birks and Son, manufacturing jewelers, who are amalgamating with Porte & Markle, would be buying machinery for the enlarged plant. It appears, however, that for some time they will make the largest possible use of the equipment formerly used in the Porte & Markle plant, which is being transferred to the new premises.

A new machine shop has opened up at Moosomin, Sask., for general repair work. The machine tool equipment required was supplied by the A. R. Williams Machinery Co., Winnipeg, and included lathes, drill, shaper, and other smaller tools.

The Hudson's Bay Co., contemplate building a sawmill at Fort McMurray, to enable them to fit out a steamboat, the framework for which was recently erected by the Doty Engine Works, Ltd., Winnipeg, and is being shipped by rail to the above point.

The building permits granted in Winnipeg for the coming summer are away ahead of what they were last year, which indicates that demands for structural steel, builders' hardware, etc., should be heavy, a contingency altogether unexpected.

It is understood that the Ford Motor Co. of Walkerville and Detroit, are contemplating erecting a branch plant in Winnipeg to take care of their business in Western Canada.

St. John, N.B., April 4, 1914.—The increasing importance of St. John in the industrial world is indicated each week by the several letters from firms in Upper Canada, England, and the United States, written to the Board of Trade, asking information regarding possibilities, facilities of shipping, trade regulations, etc. The Board of Trade have been conducting an active campaign for the promotion of new industries, and thus far have been very successful. H. T. Hoag, former secretary, who was brought here from Poughkeepsie, N.Y., at a $4,000 salary, has resigned, and R. E. Armstrong, a former St. John man, has been appointed to keep up the good work.

A new company called the St. John Knitting Co. has been organized, to take over the plant of the Parks Knitting Co., operated under direction of the late W. J. Parks in St. John. It is the intention of the company, which is headed by Walter E. Foster, managing director of Vassie & Co., to enlarge the plant and install more modern machinery, and to possibly engage in the manufacture of other lines, such as sweaters and fancy knitted goods. The company has secured the lease of the building in which the factory is conducted for another term.

E. G. M. Cape, head of the E. G. M. Cape Construction Co., while in St. John this week said that the expectation was that the building of the Atlantic Sugar Refineries, Ltd., would be completed by May. "The steel work was finished long ago," he said. "The placing of the machinery is, of course, a separate contract and may take some time, but the expectation is that the refinery will be in operation this summer."

A manufacturer from Upper Canada has been in Gibson, N.B., recently, looking over the ground with the idea of the establishment of a plant for the manufacture of barrels and staves.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Personal

J. B. Woodyatt has joined the staff of the Southern Canada Power Company of Montreal.

G. Herrick Duggan, general manager of the Dominion Bridge Co., Ltd., is on a visit to Vancouver, B.C.

H. S. Holt, president of the Royal Bank of Canada, who is at present in Egypt, is expected in London, England in a few days.

D. W. Houston has been appointed acting superintendent of the Regina street railway system in place of Mr. H. Doughty, who has resigned.

H. E. Sherk, president of the Canadian Hart Wheels, Ltd., Hamilton, sailed from New York, recently, to spend six months in Germany and England.

Robt. A. Lyons, who, for over 15 years was chief engineer of the London Electric Co., has been appointed representative of the Garlock Packing Co., for Western Ontario.

C. A. Page, local purchasing agent of the Canadian Steel Foundries, Ltd., Welland plant, has resigned to accept the position of sales manager for the Canadian Hart Wheels, Ltd., Hamilton.

C. R. Walker, of the Cross Fertilizer Co., Sydney, N.B., has returned from a business trip through Ontario and expects to leave shortly for the West on a similar mission.

George E. Etlinger, of the firm of J. Birch & Co., London, Eng., export engineers, is making a tour through Canada. Mr. Etlinger will appoint agents to handle specialties on behalf of a number of British manufacturers.

David Webster, chief engineer of the Brantford, Ont., waterworks, was presented by the Board of Works Commissioners, with a gold watch suitably inscribed, in recognition of his 25 years of service with the city. He was previously for 12 years with a private company which owned the plant prior to civic ownership.

L. L. Anthes, manager of the Anthes Foundry, Ltd., Winnipeg, who has been at the Toronto plant for several months, is returning to Winnipeg. Business in the latter city is showing marked signs of improvement, especially lines of soil pipe. A staff of 45 men has been taken on, and this will be increased, it is expected shortly.

A. M. Lewis, president of the Canada Sewer Pipe & Clay Products, Ltd., Hamilton, Ont., L. P. Spittal, vice-president, and David New, expert in the company's employ, returned a few days ago from a trip of inspection through the brick plants of Ohio. The company will instal some of the latest machinery obtainable in the new plant to be opened in Hamilton.

R. Percy Sims, chief engineer and general manager in Canada for the Linde British Refrigeration Co., Ltd., is severing his connection with the company on May 1st, next, in order to devote his whole time to consulting work. his headquarters will be in Montreal. The Linde British Refrigeration Co. have consequently decided to close their Canadian office, as the profits of the branch have not been commensurate with those earned in other parts of the world. During the past three years the company have obtained a large number of orders from all over the Dominion; but, generally speaking, the returns obtained have been inadequate.

WHO'S WHO.

JOHN B. GOFF,
Sec.-Treas. Dart Union Co., Toronto.

Trade Gossip

The Polsons Iron Works, Ltd., launched on April 1, another of the six steel scows which they are building for the Quebec Harbor Commission.

Car Orders.—The Canadian Car and Foundry reports orders of 100 tank cars from the Standard Oil Co., of 50 freight cars from the C.P.R., and of 10 freight cars from the Montreal Harbor Commission.

Boiler Explosion.—One of the large boilers in the Bankhead plant of the Drummond colliery, Westville, N.S., operated by the Intercolonial Coal Co., exploded on April 2, and Daniel McMillan and J. Ryan were killed and five others injured.

The Siemens Co. of Canada, Ltd., Montreal, have received an order from the Union Carbide Co., of Welland, Ont., for some 46,000 volt single conductor cable. The cable will be paper insulated and lead covered, and will be made to withstand a test of 100,000 volts.

The General Supply Co., Winnipeg, who are Western distributers for the Beardmore Belting Co., have installed two 36-inch presses, and are now in a position to handle the belting business in proper manner. They have a large stock, and claim to have facilities unsurpassed between Toronto and Winnipeg.

The Siemens Co. of Canada, Ltd., Montreal, have received an order for over 700 water meters for the City of Edmonton. They will be of the vane type with frost protection. The order also comprises several compound meters with double ported valves and hydraulic balance, which is a special feature.

The Crystal Ice Makers, Ltd., are building a plant for manufacturing artificial ice for domestic purposes, in the Ashbridges Bay industrial district, Toronto. A fifty-ton "York" ice machine will be installed as an initial unit, followed by another of the same capacity later. The machine will be installed so that it can be operated by either a steam engine or electric motor. The raw water will be purified by electricity by means of an apparatus invented by Mr. George Bury, the president of the company. It is expected that the plant will be in operation by July 1. The company is capitalized at $300,000 and has an office at 2 Toronto street, Toronto.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Edmonton, Alta. — The Edmonton Metal Works have started the erection of their new factory.

Kenora, Ont.—The Vapo Stove Co. are making Vapo oil-gas burners. R. J. Cox is the inventor.

Young, Sask.—The North American Machinery Co. will build a warehouse here and handle all kinds of machinery.

Bridgeburg, Ont.—D. T. Johnston, of Toronto, is at the head of a syndicate who propose building a factory here for making automobiles.

St. John, N.B.—It is reported that a company will establish a structural steel plant here, if assistance can be obtained from the city. Mr. H. Ewing, of Wetherby, Pa., is interested.

Windsor, Ont.—The Canadian Thurber Rotary Co. is to start operations here to manufacture rotary valve motors and an attachment for inflating automobile tires.

Niagara Falls, Ont.—The Davis Acetylene Gas Machine Co. has contracted to manufacture metal locker cabinets in its factory here for the Canadian Automatic Parcel Checking Co.

Fort William, Ont.—C. P. McLennan of Halifax, N.S., is engaged in promoting a company which will be known as the Anglo-Canadian Locomotive Co. The company will erect a plant here for building locomotives.

Thorold, Ont.—F. J. Anderson and R. H. Ford have purchased the Stewart Foundry, and will operate the business under the name of the Thorold Iron Works. They will manufacture contractors' plants, hoisting engines, etc.

Gananoque, Ont.—The Ontario Steel Products Co. has purchased from the Rathbun Company a strip of land near the Jones Shovel plant. The land will be utilized for the erection of an addition to the finishing department of that establishment.

Ingersoll, Ont.—A special meeting of the council was held on March 28, at which a by-law to provide for a loan of $15,000 to Wilson & Short, and to authorize the taking over by that firm of the Standish agreement, was given a first and second reading. The voting on the by-law will take place on Wednesday, April 22.

Hamilton, Ont.—The engineers of the Chicago financiers behind the United Gas & Fuel Company, are in the city. They have approved of extensions to the old Hamilton Gaslight Co.'s plant to cost $50,000. The company is asking a reduction in the duty on coal that will be used for the manufacture of coke, and promise to expend at least $2,000,000 on a plant if it secures the reduction.

Thorold, Ont.—Voting took place on April 2 in Thorold Township on a by-law to grant James Battle, as trustee for the Exolon Co., a fixed assessment of $5,000 for a term of ten years on five acres of land adjoining the town of Thorold. The by-law was carried by a majority of 250. The Exolon Co., which will manufacture artificial abrasives, will break ground for the erection of their plant in a few weeks' time.

Electrical

Galt, Ont.—It is probable that a substation will be built here to take care of the increased demand for hydro-electric power.

Grand Mere, Que.—It is announced that work will shortly be started on the construction of the power plant of the Laurentide Co.

Woodbridge, Ont.—A by-law will be voted on by the ratepayers on April 11 to authorize the council to raise $6,000 in debentures for a hydro distributing plant.

Ottawa, Ont.—As the result of objections made by the Ontario Hydro-Electric Commission to the Niagara & Welland Power Co.'s bill for permission to make extensions, etc., the bill has been withdrawn.

Peterboro, Ont.—The Provincial Legislature has decided that the city cannot be forced into buying the Auburn Power Company, which is a subsidiary of the Peterboro Light & Power Company. The city will take over the latter.

St. Catharines, Ont.—By arrangement with the Ontario Hydro-Electric Commission, the line of the Ontario Power Co., which supplies power to several manufacturing concerns in St. Catharines, has been turned over to the St. Catharines Hydro Commission, and the rates will hereafter go into their treasury.

Municipal

Berlin, Ont.—The Berlin Light Commission have decided to erect a gas holder at a cost of $40,000.

Vancouver, B.C. —It is understood that the city will purchase a fire boat for fire protection on the waterfront.

Cobourg, Ont.—Stirling has organized a Board of Trade with Mr. J. B. Morton as president, and Mr. F. Ward, secretary.

Hamilton, Ont.—The controllers have approved of a by-law authorizing an issue of $125,000 of debentures for water works extensions and improvements.

Brampton, Ont. — A by-law will be voted on by the ratepayers to authorize a grant of $20,000 in bonds and exemption of taxes to the Imperial Iron & Steel Co.

Moose Jaw, Sask. — The voters of Moose Jaw will be required to cast their ballots for or against nine by-laws, involving the expenditure of $393,800, on April 24.

St. Catharines.— The St. Catharines Water Commission on March 31, decided to purchase a chlorination plant for the city water system at a coast of approximately $6,000.

Lumsden, Sask.—The town council are considering the question of taking over the lighting and power plant from the local company at a cost of $23,000. The plant consists of a Diesel engine, pumps and electrical apparatus.

Ottawa, Ont. — Owing to the increased consumption of municipal electric power and current it has been found necessary to enlarge the municipal plant on Laurier avenue. The extensions will be made this spring. The plant will be extended back as far as the canal.

Portage la Prairie, Man. — William Richardson announced recently that negotiations are under way with the representatives of the Bull Tractor Engine Co. to locate in the city, and, although nothing definite is yet to hand, it is understood that Portage has a good chance to land the big industry.

Elmira, Ont.—At the regular monthly meeting of the Elmira Board of Trade held recently, the question of purchasing additional land for waterworks purposes was fully discussed. It was, however, decided to give the ratepayers a chance to vote on this.

Sarnia, Ont.—As a result of the campaign inaugurated by the Board of Trade, the committee have decided on the words "The Beacon City" as a descriptive title for the City of Sarnia, and for the slogan or motto the words: "Sarnia Lights the Way."

Wallaceburg, Ont.—At a meeting of the council on April 1, Dr. Campbell, chairman of the water and light committee, announced that the Wallaceburg Gas Co. had refused the town's offer of $30,000 for the plant, saying that $35,000 was wanted. As a result of the refusal to sell at what is regarded as a reasonable figure, the town will consider a by-law to contract for hydro.

Calgary, Alta. — A water works scheme, involving an expenditure of in the neighborhood of $2,000,000, will eventually be entered into by the city, as a result of a report made the city council by A. W. Fawkes, municipal water engineer. Mr. Fawkes recommends the establishment of large storage dams on the Elbow river, which brings ice-cold water from the Rocky Mountains right to the city.

Waterloo, Ont.—The Waterloo Town Council have agreed to submit a by-law to the ratepayers at an early date providing for a loan of $50,000 to the Globe Furniture Co., at 5 per cent. interest, repayable in twenty annual instalments; exemption from taxation for a term of ten years, and the grant of a site of one acre of land not to exceed $1,000 in cost, on condition that the company expends $125,000 in buildings and machinery, increasing the number of employees from 85 to 150 the first year and to 200 the second year; the building when erected to be four storeys, 48 by 150 feet. The date when the vote will be taken has not been fixed.

General Industrial

Chatham, Ont.—It is reported that a Toronto concern is negotiating with the city council with the object of locating here.

Edmonton, Alta. — W. J. Milford, of the Winnipeg Paper Box Company, of Winnipeg, is in the city looking over the ground with a view to opening a branch here for the manufacture of their product, which consists of paper boxes of every description, both folding and set up.

Toronto, Ont.—The Canadian Kodak Co., Ltd., are calling tenders for the construction of their new factory at Mount Dennis.

Montreal, Que.—Fire destroyed part of the tannery of the Bonner Leather Co. on March 29. The damage is estimated at $15,000.

Newmarket, Ont.—The machinery to drill the new well on the Office Specialty Co.'s property has arrived, and work will be started at once.

Grimsby, Ont.—It is understood that a new industry will be established here. The company will manufacture soap and cleaning powders.

Strathroy, Ont.—It is probable that a by-law will be voted on to grant a bonus to a shoe company who are proposing to build a factory here.

Duncan, B.C.—The Interior Hardwood Co. have purchased a site here and will build a factory for manufacturing polishes, dressings and toys. Mr. Otto H. Martin is president.

Bashaw, Alta. — The large elevator owned by the Gillespie Co., of Edmonton, has been completely destroyed by fire, and the total loss is estimated at $15,000. The elevator was almost filled with grain.

Calgary, Alta. — It is reported that about thirty elevators will be constructed by the Alberta Farmers' Co-operative Elevator Co., Ltd., this coming season in the province. E. J. Fream is the manager of the company.

Toronto, Ont.—A holding company under the name of Canned Goods, Ltd., and with a capital of $100,000, has been formed by forty of the independent canneries of the province. The headquarters will be on Front Street.

St. John, N.B.—Fire destroyed part of the plant of the St. John Nail Works on March 28. The damage is estimated at $20,000 about half being covered by insurance. The machinery was not damaged to any great extent.

Montreal, Que.—Owing to the appreciation shown by the Canadian public of a British-made article, the proprietors of the "Lively Polly" Soap Powder, a Lancashire product, are contemplating building a factory in Montreal. Mr. J. Mason Hargreaves, McGill Building, is their representative.

Goderich, Ont.—Another salt well will be bored here at a cost of $2,500, to supply the salt refinery which is having its capacity increased from 120 barrels per day to 800 barrels by the present owners. The owner of the establishment, Mr. John Bansford, of Clinton, has just installed $40,000 worth of new machinery.

Galt, Ont.—Word has been received here that the Canadian Cereal Milling Co. will move its head office, now located in the Lumsden Building, Toronto, to Galt, not later than May 1. The local mill is one of the most important in the chain of mills controlled by the merger, and no doubt Galt's central location brought about the transference of the head office here.

Sault Ste. Marie, Ont.—At a special meeting of the city council held on March 27, a new arrangement was entered into with Mr. A. H. Reid, of the Reid Incinerator Co., for the erection of an incinerator here. According to the new agreement, the company will build an incinerator, with a daily capacity of twenty tons, for $14,000, which the city will pay in cash, disposing of its bonds itself.

Sarnia, Ont. — The Dominion Salt Company have under construction an addition to their present plant in the shape of a building 100 feet long by 40 feet wide. The company has decided to manufacture a table salt packed in cartons, and, in order to do this, more plant room is needed. New machinery will also be installed to manufacture the new salt, which is prepared by special process.

New Westminster, B.C. — The St. Mungo Cannery Co. have purchased a site, and will erect a cold storage plant adjoining their present factory. The present machinery equipment will be more than doubled, as Mr. Anderson is planning to eliminate the existing steam outfit and install an additional electrical unit. Tenders for pile driving are expected to be called some time this week, while the final plans for the buildings are expected to be in the hands of the city council and the building inspector at an early date.

The Ogilvie Flour Milling Co. expects to increase its elevators in the Province of Alberta by fifteen this year, states W. A. Black, general manager, who has returned from a trip through the West with George Bury, vice-president of the C.P.R. He could not at present say where these additional elevators would be located, the plans so far only being tentative. These elevators will feed the company's mills at Medicine Hat. It was not likely, he continued, that any additional elevators would be erected in the Provinces of Saskatchewan and Manitoba.

Wood Working

Belleville, Ont.—It is reported that a concern in Toronto who manufacture store fronts will probably locate here.

Oakville, Ont. — The Davis & Doty Company will make an extension to their planing mill.

Fort Frances, Ont.—R. C. Langstaff and Chas. Schurg are building a box factory at Emo on the site of the old grist mill.

Stratford, Ont.—The Diebel Mfg. Co., will build a factory for manufacturing frames and chairs. A complete equipment of new machinery will be required.

North Bay, Ont.—Ferguson & McFadden's sawmill at Tomigo Village, 27 miles from North Bay on the T. & N. O. R., was totally destroyed by fire on April 2, with a loss estimated at over $50,000. This mill is one of the largest in Northern Ontario.

Galt, Ont. — The Waterloo Town Council has agreed to submit a by-law to the ratepayers at an early date providing for a loan of $50,000 to the Globe Furniture Co., of that town, and exemption of taxes for a term of ten years, and granting a site of one acre of land, not to exceed $1,000 in cost, on condition that the company expends $125,000 in building and machinery, increasing the number of employees from 85 to 150 the first year, and to 200 the second year. The building to be erected will be four storeys, 48 x 150 feet.

Tenders

Toronto, Ont.—Tenders will be received up to Tuesday, April 14th, 1914, for the excavating, laying and jointing of water pipes, valves, hydrants and special castings, for the year 1914. H. C. Hocken, Mayor.

Ottawa, Ont.—Sealed tenders, addressed to the undersigned, for electric dynamo, steam engine, switchboard, etc., at Quarantine Station, Grosse Isle., Que., will be received by the Department of Public Works, Ottawa, until Monday, April 20, 1914, for the above mentioned machinery, etc. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Building Notes

Toronto, Ont.—The A. Muirhead Co., Ltd., will erect a warehouse at the corner of King and Frederick streets. The building will be four storeys and of mill construction.

Woodstock, Ont. — The council have had plans prepared for a new city hall which it is estimated will cost $75,000.

Toronto, Ont.—The Engineers' Club, whose premises are at present on King Street West, will build a four-storey brick building, having a frontage of 78 feet on University Avenue. The property extends through to 205 Simcoe Street. To cover the cost of the new club building, which is estimated at $150,000, each of the 450 members of the club will enter into a bond of $150.

Contracts Awarded

Chas. Barber & Sons, Meaford, Ont., have received an order from Moirs, Ltd., Halifax, for a water turbine.

Point Grey, B.C.—The council have awarded a contract to the American La France Co., for a motor hook-and-ladder truck to cost $8,800.

Montreal, Que. — Armstrong Whitworth Co., Montreal, have placed an order with Bruce, Peebles, Ltd., Edinburgh, Scotland, for two 350 k.w. motor converter sets.

Prince Rupert, B.C.—The town has placed an order with Gerald Lomer, Ltd., Montreal, for a quantity of 18 in. and 45 in., steel piping at a cost of $86,000.

Toronto, Ont.—One hundred thousand rural mail boxes have been ordered by the Dominion Government from the International Mail Equipment Co. of Canada, Toronto, and work is to be commenced at once, since the first 10,000 must be ready by June 15. The new boxes are similar in design to those now in use, but are larger. The International Mail Equipment Co. has no factory. It is really a Canadian branch of the same concern in the United States, and a factory is to be secured here for immediate operations. The boxes ordered will cost $4.25 each.

New Incorporations

The Dominion Lock Co., incorporated at Toronto, capital $100,000, to manufacture, sell, and generally deal in locks, etc., at Toronto. Incorporators: Alva C. Hollins, John J. Williams, etc., Toronto.

The Stanworth Power Co., Ltd., incorporated at Ottawa, capital $250,000, to purchase or otherwise develop electric power at Toronto. Incorporators: William J. Simpson, Stewart W. Hall, etc., Toronto.

The McLean Construction Co., Ltd., incorporated at Toronto, capital $500,000, to carry on a building and construction business at Toronto. Incorporators: Malcolm K. Lennox, Bruce F. Fisher, etc., Toronto.

The Brantford Computing Scale Co., incorporated at Toronto, capital, $150,000, to manufacture and deal in scales, etc., at Brantford, Ont. Incorporators: Archibalt L. McPherson, Joseph L. Howard, etc., Brantford.

Williams Shoe, Ltd., incorporated at Ottawa, capital $200,000, to make, manufacture and otherwise deal in leathers of all kinds, at Brampton, Ont. Incorporators: John McMurchy, Charles M. McCollum, etc., Brampton, Ont.

Railways—Bridges

Welland, Ont. — The Erie & Ontario Railway Co., propose to build a line between Port Maitland and Port Colborne. Application has been made for a charter.

Guelph, Ont.—Another step in the Guelph-to-Orangeville hydro radial line was taken on April 6 when a public meeting was held at Orangeville to discuss the question.

Alliston, Ont.—Mr. Frank Barber, Engineer of the County of York, has called tenders for a bridge over the Nottawasaga River at Nicolston, near Alliston. The bridge will be of steel construction and will have a clear span of 125 feet.

Toronto, Ont.—County Engineer Barber will immediately call tenders for the new bridge near Thistletown, ordered to be built by the Etobicoke Township Council recently. It will be constructed of reinforced concrete at a cost of about $4,000.

Windsor, Ont. — Mayor Clay announces that he will take steps immediately to bring about the building of a municipal street railway. He believes that among other advantages it would be the first steps in the merger of Walkerville, Sandwich and Ford City with Windsor.

Welland, Ont.—The Grand Trunk Railway has purchased a new steam motor car, capable of hauling a number of passenger coaches, to be used on the Buffalo-Port Colborne service. The new car seats fifty-five passengers, is of latest type, and is equipped with a modern baggage vestibule.

Brantford, Ont.—By an overwhelming majority, Brantford ratepayers on March 23 voted in favor of the purchase of the street railway and Grand Valley

Railway from here to Galt, for the sum of $253,000. The vote was 1,317 in favor and only 83 against, a margin of 1,234.

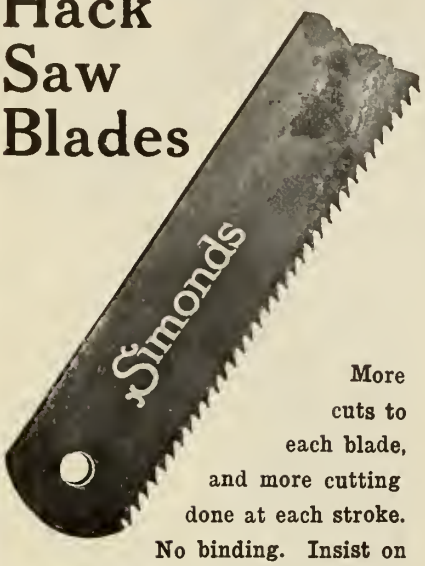
Berlin, Ont.—Representatives of the Canadian Northern Railway have been busy in this vicinity negotiating for an entrance to the city for its line to be constructed this year from Toronto via Guelph. In all probability the railroad will enter the city by the East Ward, as the company has been examining options on a right-of-way in that locality.

St. John's, Nfld.—Much interest has been excited in the efforts of the Colonial Government to negotiate a loan of $2,000,000 for railroad development to which the Administration is pledged. Sir Edward Morris, Premier, left for London on March 14 by way of New York, and Governor W. E. Davidson left direct for Liverpool on March 18, for the purpose of trying to raise the money.

Toronto, Ont.—The Legislature passed a resolution on March 25 unanimously approving the action of the Provincial Hydro-Electric Power Commission taking up the question of providing radial lines for the rural districts, and memorializing the Dominion Government to grant financial aid to such railways in all respects equal to subsidies given steam railroads.

Halifax, N.S.—A bill has been introduced in the Legislature to incorporate the Nova Scotia Tramways and Power Co. It provides that the company's capital shall be $5,000,000, with power to increase it to $10,000,000, and an authorized bond issue of $9,000,000. The bill authorizes the company to purchase the Halifax Electric Tramway Co., and that corporation is empowered to sell at a price of $170 for each share at present outstanding of the Tramway stock.

Ottawa, Ont.—The Railway Committee on March 25 granted the Gananoque and Arnprior Co. power to run a branch line from the main road between Gananoque and Arnprior, through the rear of Leeds and Lansdowne, Bastard, Kitley, Elmsley, Wolford, Montague, Marlborough, North Gower and Nepean to the city of Ottawa, in the County of Carleton. The bill was altered slightly so as to better show the route of the road.



Union Station, Toronto.—Mr. J. R. Ambrose, chief engineer for the Toronto Terminal Railway Co. will open tenders next week for the building of the new Union Station. The officials claim that it will take about two weeks to consider the contracts before they are awarded. This means that the work cannot be started until the end of April. The officials of both the G.T.R. and C.P.R., with their architects, have agreed on the details of the plans. The consulting engineers are Chief Engineers H. R. Safford and J. M. R. Fairbairn, of the G.T.R. and the chief engineers of the Canadian Pacific Railway.

Trade Gossip

The Siemens Co. of Canada, Ltd., Montreal, have received an order from the Canada Cement Co., for 5 sets of 12,000 volt switching apparatus, with three-tank oil switches, panels, etc.; also for 4 sets of lightning arresters, each set to consist of three horn gaps, triple-pole oil-immersed damping resistance, Siemens special triple-pole coil, together with disconnecting switches.

The Siemens Co. of Canada, Ltd., Montreal, have received an order from the Canadian Ingersoll-Rand Co., for two 380 h.p. 3-phase, 2200 volt, 60 cycle, 146 r.p.m. induction motors of the slip ring type, provided with short-circuiting and brush-lifting device; also an

order for two Siemens liquid starters and cast-iron mining pillars from the Acadia Coal Co., Nova Scotia, to be used for driving air compressors.

Mumford Molding Machine Co.—The New York office of the Mumford Molding Machine Co. was closed April 1, and E. H. Mumford, vice-president and general manager, moves his office to the factory, 2059 Elston Avenue, Chicago, Ill., in order that he may be in close touch with the business. All mail should be sent to Chicago, but Mr. Mumford may be addressed personally c|o Machinery Club, while in New York.

Siemens Co., of Canada, Ltd., expect to ship soon a 500-k.w. motor generator for the King Street, Winnipeg, substation, consisting of a 500-k.w. d.c. generator, compound wound, with commutation poles, 550/605 volts, 720 r.p.m. direct-connected and mounted on combined bed-plate, with one self-starting synchronous motor, 3-phase, 2,200 volts, 60 cycles, and also a direct-connected exciter. This is the third 500-k.w. set the City of Winnipeg have purchased from this company.

Catalogues

The Willson Safety Service bulletin No. 3 is being distributed by T. A. Willson & Co., Reading, Pa. The bulletin deals with the "Willson" safety glasses and eye protectors for the use of mechanics and others. Copies may be obtained from the Canadian office, 23 Scott street, Toronto.

Power and Hand Brushes, the product of the Manufacturers' Brush Co., Cleveland, O., are dealt with in detail in Catalogue "A," which we have received. The catalogue covers a complete line, and illustrations are given of many types of brushes for various purposes, such as for foundry use, etc.

The Morris Traveling Spur-gear Chain-block is described in Bulletin No. B3, which we have received from the Herbert Morris Crane and Hoist Co., Ltd., Toronto. The bulletin is fully illustrated, showing several applications of the spur-gear chain-block, and tables give the capacity, price and other data for each size. The principal constructional features are also dealt with briefly.

The Arctic-Pownall Shell Brine Cooler is the subject of bulletin No. 5, published by the Arctic Ice Machine Company, Canton, Ohio. The bulletin explains the construction and operation of the "Arctic-Pownall" shell cooler and touches upon the advantages of this device for use in raw water ice-making systems. It is stated that by means of this device, the capacity of existing freezing tanks can be increased. The bulletin, which is illustrated, will be mailed to interested readers.

The "National Bulletin," No. 11B, house organ of the National Tube Company, Pittsburgh, Pa., has come to hand. This number contains 28 pages, and is entitled, "History, Characteristics, and Advantages of National Pipe." The bulletin contains much interesting information relative to the history of pipe and its manufacture, with particular reference to "National" pipe, together with data on service tests. The physical properties of "National" pipe are dealt with, and its application for various services treated at length. The bulletin is fully illustrated.

Link Belt data book, No. 125, is a publication of more than ordinary merit, and is a worthy successor to the previous catalogues published by the Link Belt Company, New York and Philadelphia. The catalogue deals exclusively with "Link Belt" silent chain and accessories, describing in detail the design and construction, together with illustrations showing the principal features referred to in the description. There are several interesting tables giving list prices for various pitches of chains, horse-power tables, ratios, standard motor drives, horse-power transmitted by shafts and belts, etc. The catalogue also contains some useful data on chain drives and diagrams of typical automobile drives. Other illustrations include views of numerous installations, showing the wide field covered by this form of drive. This is a well-arranged and attractive catalogue, and will be useful for those interested in transmissions.

Book Reviews

New Foundry Journal.—The foundry and casting industry of Austria-Hungary has just received an addition to the ranks of its literature in the issue of "Der Giesserei-Betrieb," a journal which proposes to devote itself to the interests of all branches of the metal industry. The publication will appear twice monthly, and the subscription rate is 16 kronen ($3.25) per annum. The editorial offices are situated at Erdbergerlande, 6 Vienna III., Austria.

The Report of the Director of the Bureau of Mines has been published by the Government Printing Office, Washington, D.C. This is the third annual report published by the Bureau of Mines under the direction of Joseph A. Holmes. The report covers the work done up to June 30, 1913. Much interesting information is contained in the report, together with several tables, and

The Utilization of Petroleum and Natural Gas in Wyoming is the title of technical paper 57, published by the Bureau of Mines, Department of the Interior, Washington, D.C. This bulletin contains a preliminary report on the above subject, compiled from data obtained during an investigation into the possibilities of the State of Wyoming as an oil producing region. Each field is dealt with separately and an analysis given of the oil or gas found there. The concluding pages are devoted to a paper on "The Suitability of Natural Gas for Making Gasoline," by George A. Burrell.

Electric Switches for use in gaseous mines is the subject of bulletin No. 68, published by the Bureau of Mines, Department of the Interior, Washington, D.C. The main purpose of the investigations described in this bulletin was to obtain information upon which to base future tests of a similar character. The tests described were made with various types of electric switches to find out the most suitable for use in gaseous mines. Illustrations are given of the various switches tested, with a description of each switch and method of conducting the test, the results being carefully tabulated.

The Report of Progress of Stream Measurements has recently been published by the Department of the Interior of the Dominion Government, Ottawa. The report which contains 450 pages, with index, was prepared by P. M. Sauder, chief hydrographer, under the direction of F. H. Peters, commissioner of Irrigation. The report covers all the work done during 1912 in the measurement of streams, study of conditions affecting flow, information collected concerning the duration and magnitude of floods, irrigation, water powers and storage, etc. The field of operations was extensive, covering a large number of rivers and streams in Alberta and Saskatchewan, where gauging stations were established and records taken. The method of procedure is described, and a list of streams given, with the location of stations and date when established. A general description is given of each drainage basin, the data collected being arranged in tabular form and containing much useful information for use in hydrographic studies. The report contains over 70 excellent plates of various streams and dams reproduced from photographs taken in the field by members of the staff. The concluding pages of the report are devoted to an appendix on "Rating Current Meters," by H. O. Brown.

SIEVERKROPP ENGINE

A New Type of ENGINE

We claim the greatest improvement made in gasolene engines in many years.

Here is a 2-cycle, 1½ H.P. engine with the strength and durability of an expensive and cumbersome 4-cycle engine. Easy and economical to operate. Runs as smoothly as an electric motor. Will run any machinery requiring not over 1½ H.P. Send for catalogue.

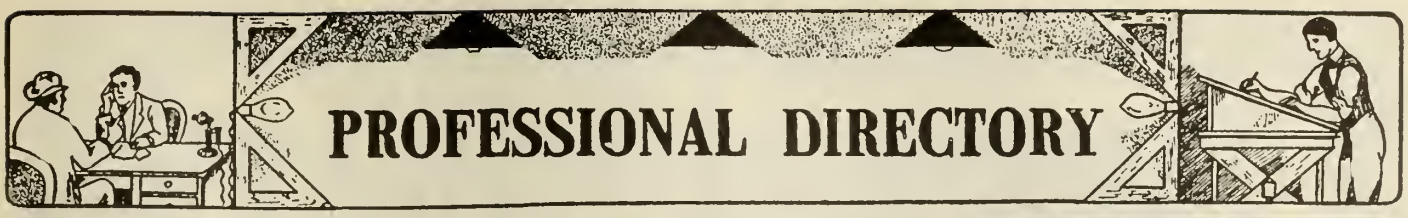
Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.



For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

This style cabinet, fitted with special lock, is just the thing for valuable tools, precision instruments, dies, etc., with which particular care should be taken.

Steel vs. Wood

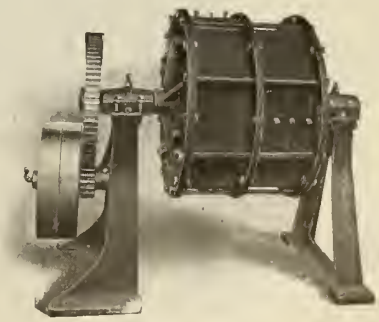
Of the many advantages not possessed by wood, but found in Dennisteel equipment, the following are a few:

FLEXIBILITY	SANITARY
COMPACTNESS	THEFT PROOF
EASILY DISMANTLED	EASILY CLEANED
WILL NOT WARP	NON-INFLAMMABLE

The Dennis Wire & Iron Works Co. Limited

LONDON, CANADA

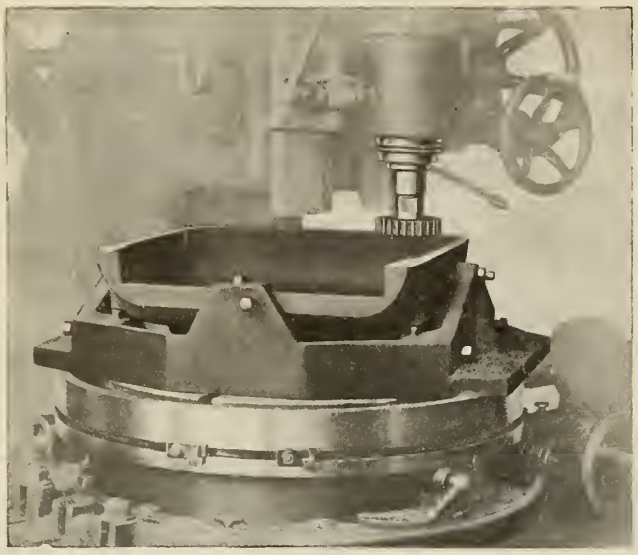
The Abbott Way



is the logical way to finish all your small parts.

Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.

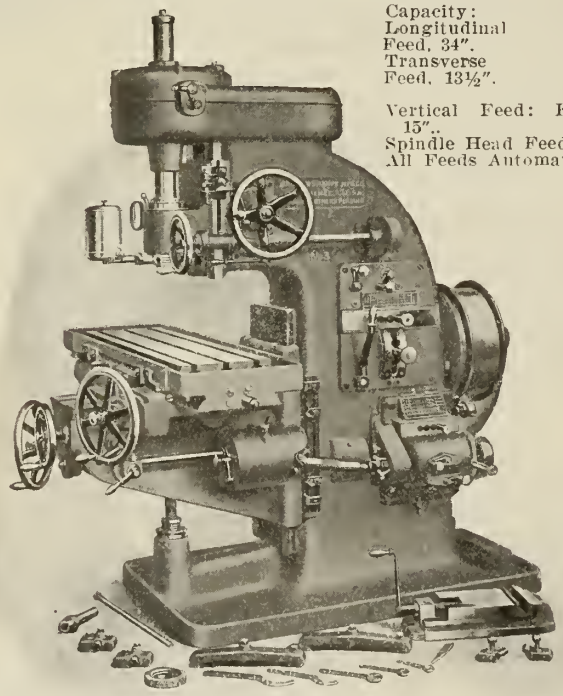


If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

The Abbott Ball Company

1047 Elmwood Avenue Hartford, Conn.



How We Reduced Time Per Piece One-Half

Casting sides are ½" thick, and edges are finished to an oil-tight fit.

Usual method is to follow around edges with small cutter, using longitudinal and transverse feeds in turn. We put the castings on a circular milling attachment and revolve them under cutter, giving a continuous cut. The shorter distance the mill has to travel and saving in changing feeds enables time per piece to be reduced one-half.

This is the machine and it is well adapted for heavy service vertical milling in your shop.

Capacity:
Longitudinal Feed, 34".
Transverse Feed, 13½".

Vertical Feed: Knee, 15".
Spindle Head Feed, 8".
All Feeds Automatic.

Arbor Press Equipment

Has the same relation to your shop work as your vault has to your books of record, cash and office valuables. You stop leaks in your office as quickly as possible.

Eames Presses eliminate waste and safeguard against unnecessary destruction of work. For pressing bushings, pins, broaching, fitting couplings, driving mandrels, etc., there is but one way to obtain the quickest, cheapest and best results.

Manufactured by

The G.T. Eames Co.
412 Oakland Drive
Kalamazoo, Mich., U.S.A.

For sale by leading dealers everywhere.

"GRIPOLY"

Solid woven Hair Belting can solve transmission problems for you that the ordinary sort of belting could not touch.

"Gripoly" gets a better grip on the pulleys, transmits over one-third more power per inch of width, and is dust, damp and acid proof.

Write for prices and discounts.

W. A. MARTIN & CO.

Dealers in all kinds of Belting

70 Lombard Street - TORONTO

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

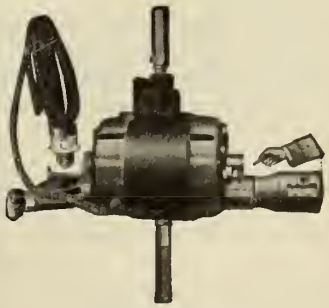
U. S. Electric Drills and Grinders



Save Time, Labor and Money

They can be attached to any lamp socket. For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.
3-16 inch, W.G.T. 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts.
Direct or alternating current.
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

The Man Who Begins Is The Man Who Wins

THE men who WIN are the men who BEGIN.

¶ Some day I will, but not just yet!'' That's hesitation and an admission of inability to make a decision.

¶ Hesitation always did come expensive and it costs more to-day than it has since it used to cost men their heads in the strenuous times of old. Hesitation is a phantom barrier across the highway of success, and to force the obstruction is to dispel it, with its attendant doubts and forebodings.

¶ The most successful and best known concerns some time or other made the move that eventually put them on top. They made the decision that started them on the way to success. They might have hesitated for years without advertising. They might have said:

¶ ''Yes, we intend to advertise, but not just yet!''

¶ But they said instead:

¶ ''If we're going to advertise at all we'd better start right now. If advertising is going to do all we fully expect it will, NOW is the time to start. We can commence right away just as well as next year—let's go to it NOW!''

¶ There are some men, too, who make the decision to advertise and work it for all it is worth for a few months and then they come to the old familiar will-o-the-wisp bogey—hesitation. ''Will we go ahead —is it paying us—had we better try some other scheme for a while?''

¶ Sticking to a decision is no less important than making one. Cold feet bring nothing but discomfort. If a decision isn't worth sticking to, why make it?

¶ John Wanamaker says that advertising doesn't jerk—it pulls. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

¶ One of the biggest men in the engineering business said to us a few weeks ago as he renewed his contracts:

¶ ''For seven years we have not known what it is to want an order. We have always been busy.''

¶ Some time ago, away back nine or ten years, a decision was made and the resultant policy has been closely followed to a big success.

¶ Get out of that habit of hesitating. It costs you a heap sight more than you think it saves you.

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

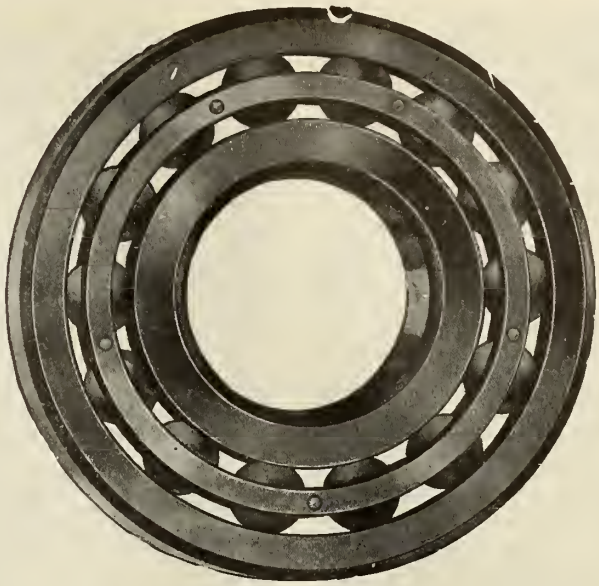
NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use **two** files where they heretofore only used **one.**

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

Nicholson-Made-Files



Brands

Kearney & Foot **Great Western**
American **Arcade** **Globe**

At your Dealer or Supply House.

NICHOLSON FILE CO.
Port Hope, Ont.

"FILE FILOSOPHY"—A 50 years' education on files in an hour, and our Catalog, sent FREE on request.

Every ball takes its share of the load in

Hoffmann

Journal and Thrust Bearings

The Reason

Every Hoffman Ball is guaranteed not to vary from absolute spherity or standard size by one ten-thousandth of an inch (about one-tenth the thickness of tissue paper.)

The Result

Because the load in Hoffman Bearings is thus equally distributed, friction is reduced to a minimum, and the life of both Balls and Races is greatly prolonged.

We have over 40 sizes of Hoffmann Balls in stock, from 1-16 to 4 inches, and over 50 sizes of Journal and Thrust Bearings.

To the Purchaser

Nowadays advertised lines are regarded as standard. Standard lines are invariably advertised. The question arises—if advertising is symbolical of quality, is the non-advertised product reliable?

You will have chosen wisely if you purchase that which boasts its maker's confidence and pride, and your requirements will be satisfactorily met if you will consult this directory whenever you are open to purchase equipment.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

If You Do You Tumbling Need Globe Barrels

THE question is not "Can I afford to use Globe Tumbling Barrels?" the question is "Can you afford not to use them?"

Globe Tumbling Barrels

are really economical—their motive is to save. They save time in running, save time in filling, and save time emptying—and the workmen do not have to stop the barrel to inspect the work.

But aside from this they give you better tumbling. And the same barrel is quickly adapted to varying kinds of work by simply changing the angle at which the barrel is running.

Taking all in all, Globe Tumbling Barrels are just about 100% efficient. They're worth all that they cost and then some. Made in eight stock sizes, price from $50 to $170. If you do tumbling you need Globe Barrels and our catalog 2. now.

The Globe Machine & Stamping Co.
Cleveland, Ohio, U. S. A.

The Foundry Problem

Foundry conditions have undergone a radical change in the last decade.

The Foundry business has evolved from a "hit and miss" business into a machine business.

In modern foundries, moulds are rammed, patterns are drawn, etc., by machinery, but cored castings are still the difficult problems and the answer, unlike the arithmetical problems of youth, is not in the back of the book.

It may be in the beginning if you will use "Stevens Core Gum."

It is a dry grey powder in no way related to Pitch Compounds.

It is a real binder; the Cores have a keen, sharp edge: they will stand when green a day, a week, or a month before baking; they produce no gas, no smoke, never "blow" and are easily released from the casting.

Stevens Core Gum possesses all the merit, not found in Core Compounds, and omits the exasperating features. A keg for trial costs nothing.

Shall I send it?

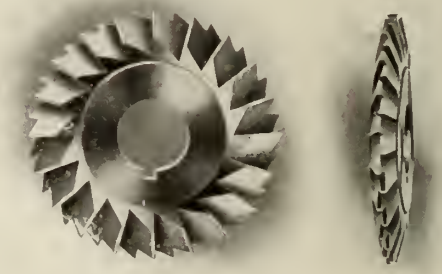
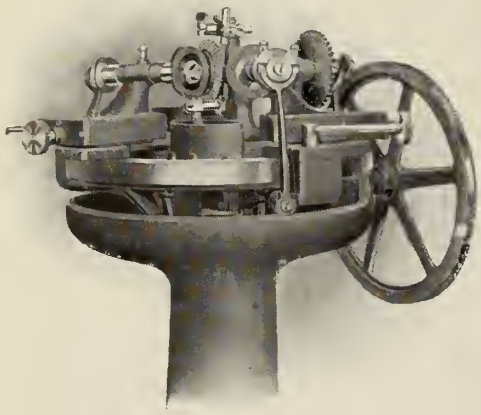
MILLED THREADS ARE BEST

As a manufacturing proposition, milled threads cannot be equaled for low cost of production and accuracy.

Three Things Absolutely Necessary for Best Results:



1—P. & W. Thread Milling Machines



which produce a smooth, accurate thread at one cut in a fraction of the time required by other methods. These machines have proven the most efficient methods of cutting threads on precision screws, worms, spiral gears, hobs, taps and are also used for splining and oil-grooving shafts.

2-P. & W. Patented Cutters

For P. & W. Thread Milling Machines.

We have made a special study of the problem of cutters for these machines. As the result of years of experimenting we have developed a very superior type of cutter. We manufacture them in large quantities and carry in stock for immediate delivery cutters for all standard threads in various sizes. We are also prepared to furnish special cutters promptly.

3—P. & W. Automatic Grinder

For P. & W. Thread Milling Machine Cutters.

To obtain the best results, use this special grinder which is designed for rapidly and accurately grinding these cutters. This machine is provided with three wheel heads and will automatically grind both the sides and top of cutters simultaneously. Write for book, "Thread Milling Machines," illustrating and describing the several sizes of machines, the cutters, cutter grinders, and various samples of work done on these machines.

There isn't any guess-work in the manufacture of Wilt Twist Drills

In the selection of the steel that goes into Wilt Twist Drills expert metallurgists from the most prominent steel mills in the world came to the Wilt factory.

They spent weeks of time in the testing of drills under actual operating conditions in order to determine exactly the proper hardening and drawing temperatures.

Hundreds of drills were used—thousands of holes were drilled.

And as a result of it all a set of standards was established up to which every Wilt Twist Drill must measure before it can pass inspection.

This is probably the most elaborate series of tests ever undertaken by a drill manufacturer.

It is simply in line, however, with the Wilt Twist Drill Company's determination to eliminate guess-work from its manufacturing processes.

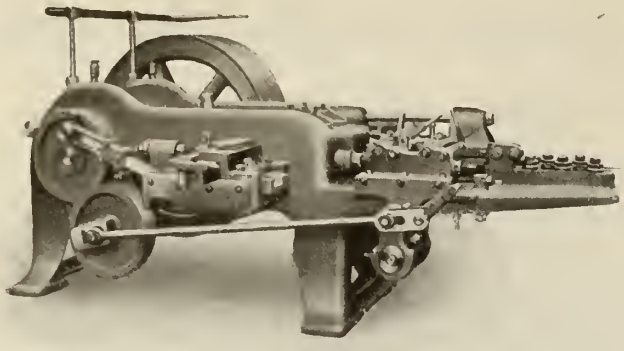
We are not guessing when we tell you Wilt Twist Drills are right.

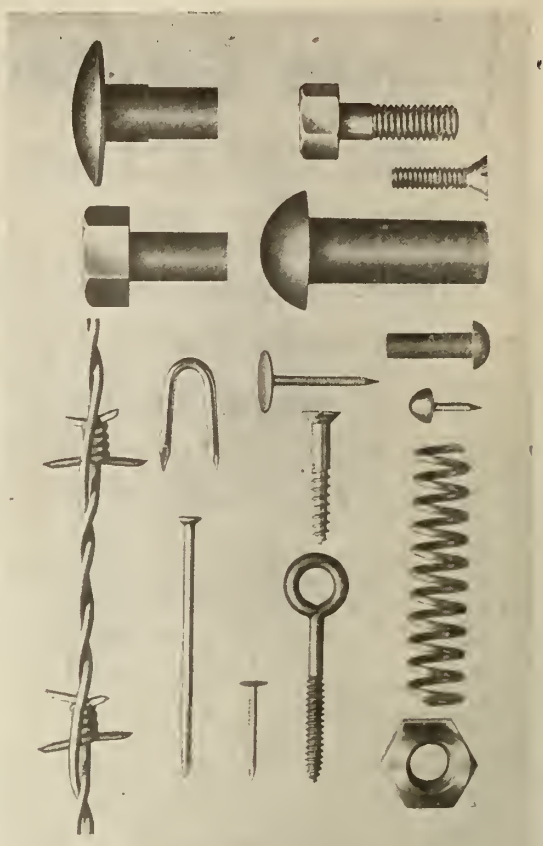
We **know** they are right.

Wilt Twist Drills are made by a new automatic process that completely machines the drill at a single chucking.

This insures absolute accuracy and uniformity — it insures the perfect contour of the grooves and ample well-defined clearance.

And — combined with the scientifically accurate hardening — it enables us to offer you the most efficient and economical drills that have ever been produced.





Hardening and drawing temperatures are determined with scientific accuracy by exhaustive tests.

Ask your supply man or write direct for literature.

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Electrical Driving of Winding Engines and Rolling Mills*

By C. Antony Ablett, A.M. Inst. C.E. and H. M. Lyons, A.M.I.E.E.

Each inroad made by electricity into fields long held by the steam engine usually marks a distinct advance in engineering science. The authors show that the electrification of mine hoists and rolling mill machinery is not only fully as feasible as that of railways and other well-known applications, but that it has much greater flexibility in admitting of automatic control, safety devices, etc.

APPLICATION TO ROLLING MILLS.

NEARLY 60 large reversing mills are being driven electrically in different parts of the world, and a modification of the Ward-Leonard system has been installed in almost every case to meet these special requirements.

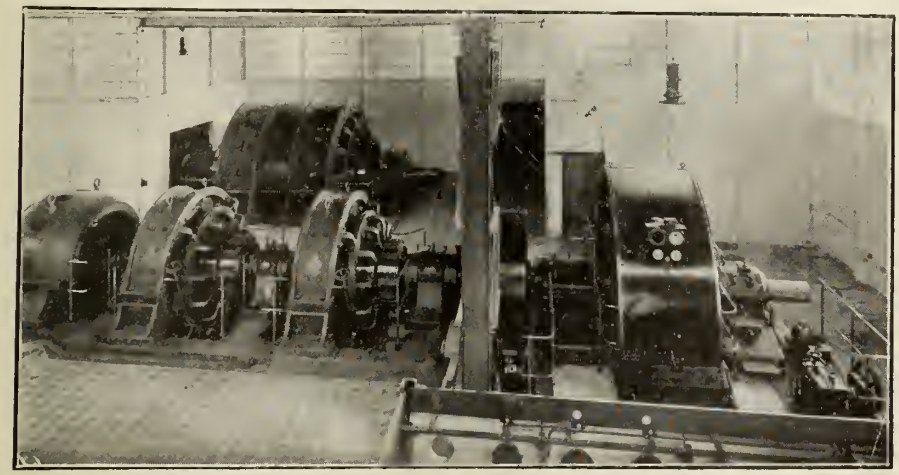

FIG. 7. GENERAL VIEW OF THE ELECTRICAL PLANT FOR DRIVING A 36-INCH REVERSING BLOOMING, ROUGHING AND FINISHING MILL AT THE SKINNINGROVE IRON WORKS. THE 12,000 HORSE-POWER REVERSING MOTOR WILL BE SEEN IN THE BACKGROUND. THE ILGNER MOTOR GENERATOR SET IS IN THE FOREGROUND, CONSISTING OF A THREE-PHASE MOTOR, TWO VARIABLE VOLTAGE DYNAMOS AND A 46-TON FLYWHEEL.

The power requirements of a reversing rolling mill impose much more severe conditions on the electrical plant than those of a large electrically driven hoist. With a large 36-in. or 45-in. blooming mill, ten to twelve passes are often made in a minute, and the power during individual passes may rise to 12,000 h. p. or more, while the total time of the passes, i.e., the total time that the ingot is between the rolls is very short compared with the total time taken to roll an ingot down to a bloom or billet. It is thus easily seen that the average power required from the power station is very much less than the maximum power which the mill motor has to give. For example, in many electrically driven blooming mills, the average power is only one-sixth or one-seventh of the maximum power. The diagrams in Fig. 12, in which the triangular or rectangular spaces show the work done per pass, illustrate how small the average power is, compared with the maximum power which has to be given by the mill motor.

In the case of an electrically driven hoist, the duration of a wind would be perhaps one minute, followed by a pause of 20 seconds or so, and the maximum power required seldom exceeds 3,000 to 4,000 horse-power, so that the average power is of the order of one-third of the maximum power. While, as has already been pointed out, it is frequently necessary to employ flywheels with winding engines it is always necessary to couple a flywheel to the motor generator set which supplies a reversing rolling mill motor, and to make provision so that the motor generator set falls in speed when the mill motor requires a heavy power to enable the flywheel to give up some of its power and then rises in speed again when the mill motor is not requiring power, thereby using the supply of the power house to store up energy in the flywheel. Experience has shown that in a steel works where electrical power is being generated in a blast furnace gas engine power station, the flywheel of the motor generator set has a very beneficial effect in keeping down the cost of this power station.

The flywheel of the motor generator set can be arranged so that it not only reduces fluctuations in the demand of power made by the mill motor to a minimum, but is also capable of reducing or even obviating peaks of short duration in the power demand, which may occur in other parts of the plant which are supplied from this power house. This is particularly the case where direct current power is being supplied. As the blast furnace gas engine has a very small overload capacity, this will obviate the necessity of running extra generating sets in order to take care of the peaks, and it will, therefore, both enable the total installed horse-power of the power house to be kept to a minimum, and will also keep down the running costs.

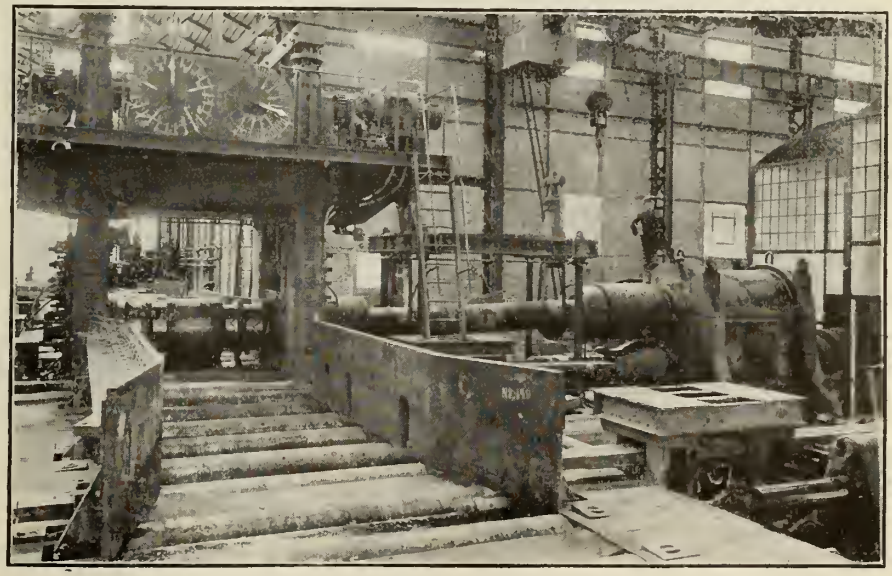

FIG. 8. GENERAL VIEW OF 36 INCH ELECTRICALLY DRIVEN REVERSING BLOOMING MILL AT THE SKINNINGROVE IRON WORKS.

*Abstract of paper read recently before the Canadian Society of Civil Engineers, Montreal.

A reversing rolling mill motor, on account of the rapidity with which it has to reverse, must be so designed that its moment of inertia is kept down to a minimum and special precautions must be taken to see that the field of the generator supplying this reversing motor should build up as rapidly as possible. This has been accomplished so successfully that it has been found possible to reverse a large reversing mill motor having rotating parts weighing over 70 tons, 30 or 40 times per minute between a speed of 60 revolutions in one direction and 60 revolutions in the other, when no steel is being rolled. Such tests naturally cannot be made while steel is being rolled because it would be quite impossible with the present type of live roller tables to return the ingots to the mill quickly enough, but such tests are useful in showing the very high rate of acceleration of the mill motor which can be obtained, and as a measure of the handiness of the mill.

Power Diagram for Reversing Blooming Mill.

Under ordinary conditions the power diagrams for each wind of a hoist are identical and can be calculated with considerable exactitude from the conditions of working, but with a rolling mill the power diagrams for each pass vary very greatly from one another, and cannot be calculated with any accuracy, for the following reasons.

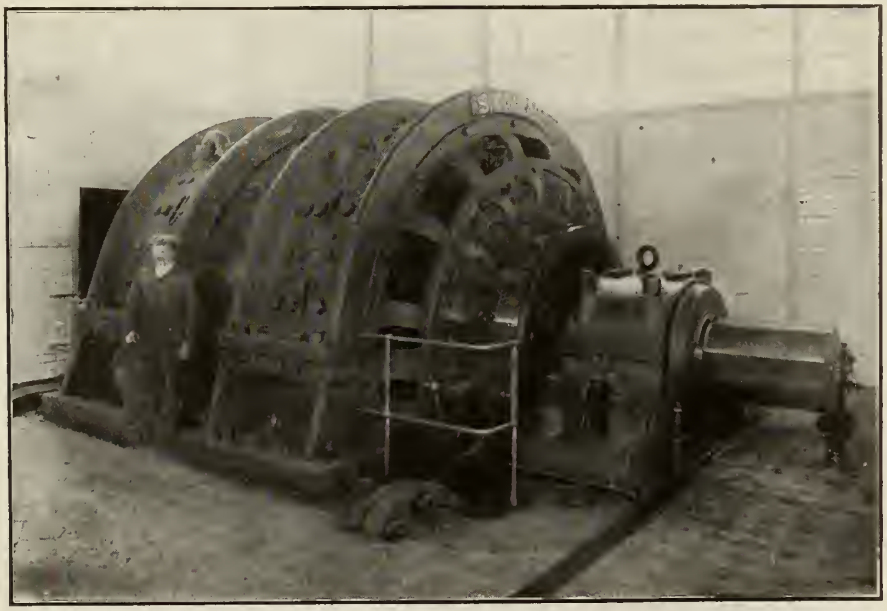

FIG. 9. A REVERSING ROLLING MILL D.C. MOTOR AT SKINNINGROVE, 12,000 HORSE-POWER, AT 60 R.P.M.; MAXIMUM SPEED, 120 R.P.M. TOTAL WEIGHT ABOUT 200 TONS. WEIGHT OF REVOLVING PARTS, 72 TONS.

During the earlier passes heavy drafts are taken, but the ingot is quite short, consequently large powers are required for very short times; but as the ingot is gradually rolled out to a bloom of considerable length and reduced in section, the drafts are diminished, as the reduction in area must be kept moderate, otherwise the bloom is damaged by the formation of surface cracks, etc., so that during the last passes the necessary power is not very great, but it is required for a considerable time.

During the first two or three passes the ingot still has its tapered shape and the metal is very spongy in character, so that the powers required are not very heavy and are very irregular. By the time that the last passes are taken the bloom has cooled down considerably and while this cooling increases the specific power required, such drafts are taken that the power required for these remains much less than that for the first passes. In a blooming mill the draft in each pass is regulated by screwing down the rolls, which brings in a personal element, so that it does not follow that the power diagrams for the rolling down of successive ingots resemble one another very closely, and in addition, ingots do not always come to the mill at the same temperature, which also brings in variations in the power diagrams for successive ingots.

It will be seen that in the design of the electrical drive for reversing rolling mills, experience and judgment play a larger part than calculation, and in any case a good margin should always be allowed to insure that the mill is not underpowered. Many tests have been carried out on electrically driven reversing mills to obtain data for the work done in rolling the various sections. Experience has shown, however, that such data should always be accepted with caution, for even where tests are made on the same mill, rolling the same material under conditions which are as similar as it is possible to reproduce in practice, considerable differences are found in the work which has to be done in rolling down the ingots, because the slight differences in the speed of rolling, in the time taken between passes, etc., which cannot be avoided in practice, have a considerable effect on the results obtained.

Action of Flywheel.

There is a great difference between the behavior of the flywheel coupled to the motor generator set used for driving a hoist, and that used for driving a rolling mill. In the case of a hoist where the power diagrams for each successive wind are almost identical, and about an equal period elapses between each wind, the flywheel gives up power during a wind and regains it during the interval, thus serving to equalize the power between individual winds and intervals.

In the case of a rolling mill, and particularly a blooming mill, the flywheel has to do a double duty, because, during the first passes made on an ingot, the mill motor has to give a large power for a very short time as the ingot is short, so that the energy consumption during the earlier passes is much less than the energy consumption during the later passes, where, although the power given by the motor is not so great, the ingot has been rolled out to a considerable length, so that a very considerable energy is required per pass. The flywheel, therefore, has to give up energy during the passes and regain it during the interval between passes, and also the flywheel gains energy during the first passes of an ingot and loses energy during the later passes, so that its speed variation has a double period, namely, a short period of about 5 to 10 seconds, corresponding to the partial equalization of power between the pass and interval, and a long period of about 3 minutes corresponding to the equalization of power over the whole time of rolling an ingot.

As the flywheel used in connection with a rolling mill has to equalize the power over a period of three minutes or so, it is usually found that these flywheels are much heavier than those applied to winding engines. The motor generator set for a blooming mill is usually supplied with a flywheel weighing about 40 tons, while a motor generator set provided for a plate mill, or a finishing mill, is generally supplied with a flywheel weighing anything from 60 to 100 tons, depending on the work which has to be done. The motor generator set for supplying hoists or winding engines is generally provided with a flywheel of not more than from 20 to 30 tons. Such flywheels would run at a peripheral speed of about 20,000 per minute, though in some cases this peri-

pheral speed has been considerably increased. A 100-ton wheel running at this speed would have a stored energy of about 300,000,000 foot lbs. or 545,000 horse power seconds, and in falling 20% in speed would give up 108,000,000 foot lbs. or 195,000 horse power seconds. The total work required to roll a 1½ ton ingot to a 4¾ x 4¾ billet is 59,000,000 foot lbs. or 108,000 horse power seconds.

Test results showing the natural balancing of the load on a generating plant supplying a number of rolling mill motors whose power varies considerably

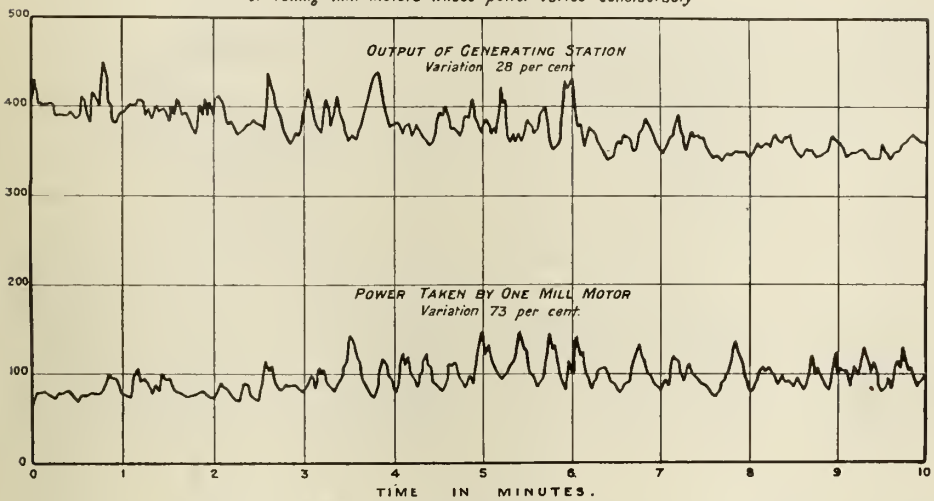

FIG. 10. TEST RESULTS SHOWING THE NATURAL BALANCING EFFECT ON THE GENERATING PLANT OF THREE ROLLING MILL MOTORS WHOSE POWER VARIES CONSIDERABLY.

Safety Devices.

The safety devices provided for an electrically driven rolling mill are of a much simpler character than those provided for a hoist, because it is not necessary to provide against the possibility of an overwind or the loaded cage falling to the bottom of the shaft due to the failure of the electric power. It is only necessary to protect the electrical plant and the mill itself against careless handling.

Shell couplings are usually provided to couple the pinion wobblers to the leading spindles to prevent the motor or pinions being shifted from their bedplate by axial thrust due to a broken roll. This feature is usually also introduced into well designed steam driven mills. A circuit breaker is provided in the main circuit between the generator of the motor generator set and the mill motor to cut off the power from the motor in case, through carelessness, an attempt is made to roll a cold ingot, or too great a draft is taken on an ingot, imposing a greater strain on the motor and mill than they were designed for.

The circuit breaker is a protection against broken rolls as well as against damaging the motor, and it must be remembered that many rolls, especially the bottom roll, have a very small factor of safety. Such a circuit breaker would be most objectionable if used with a hoist, as only the prompt application of the brakes would prevent the cage falling in the shaft when the breaker opened, but with a mill, when the circuit breaker acts the motor merely comes promptly to a standstill, and if there is an ingot between the rolls, the mill can be reversed, the circuit breaker put in, the ingot run out of the mill again, and no damage is done. This circuit breaker can either be operated instantaneously by a maximum current cut-out in the main circuit or else opened by a lever under the control of the driver. In the latter case, the field currents in the generator and motor field are reduced to zero before the circuit breaker operates; in practice this hand lever is seldom used.

During the latter passes, when the ingot has been rolled out to a bloom of considerable length, there is time to accelerate the mill to a much higher speed than is possible when rolling a comparatively short ingot, and this is desirable in order to get the work done as quickly as possible, while, as the section has become much reduced and the draft is small, a relatively small turning moment is required. The mill motor is of course accelerated to the maximum speed at which full turning moment is required by increasing the field of the variable voltage generator. The most convenient way of obtaining the additional speed without increasing the size and capital cost of the plant is by decreasing the mill motor field, though of course at the expense of reducing the possible turning moment, which decreases at a faster rate than the speed increases, but which, however, agrees very well with the requirements of the mill. There is always the possibility, however, of too heavy a draft being taken through carelessness when the mill is running at this high speed, causing an overload against which the circuit breaker would not offer proper protection. To prevent this, a relay is provided, which, when it operates, strengthens the motor field to its full value and reduces the motor speed to the maximum at which it can exert its maximum turning moment, thus both reducing the overload and putting the motor in a better position to meet it; but if the overload be still too great for the motor, the circuit breaker will open.

The purpose of the flywheel coupled to the motor generator set, as mentioned above, is to insure that the rolling mill plant takes an average steady power from the power station irrespective of any fluctuations in power the mill may require, but the value of the average steady power depends on the work that the mill is doing, i.e., the output and the section that is being rolled. If the regulating mechanism be set for the maximum average steady power, corresponding to the heaviest work that is done in the mill, and then much lighter work is done, rolling slabs for plates for instance, the power taken will fluctuate considerably, but will not exceed the value of average power for which the regulator has been set.

As this fluctuation may adversely affect the regulation of the power house, means are provided to enable the regulator to maintain a lower value of average steady power, corresponding to the work that is being done. If the regulator be set for this lower value, and heavy work is again done in the mill, the surplus power will be drawn from the flywheel to give the necessary energy, the speed of the motor generator set will sink lower and lower till at last the flywheel, whose store of energy is proportional to the square of its speed, will not be able to supply enough power to drag the billets through the mill and the mill will stall. To prevent this, two colored lamps are provided on the driver's platform to signal the speed of the flywheel. The first one, the caution signal, lights up when the flywheel is about 22% below full speed, to warn the driver that the average power is inadequate to the work he is doing, and the regulator must be set to a higher value. The second, or danger signal, lights when the flywheel is 30% below speed, and warns the driver that if he goes on he will stall the mill.

A good deal of space in this paper has been devoted to description of safety devices but it should not be considered on this account that there is any inherent risk in using such electrical plant, as the safety devices are to protect the plant against damage due to careless handling. The devices applied to steam hoisting engines, and particularly to steam reversing rolling mill engines, are of a much more rudimentary description,

and the safety of such steam plants really depends on the skill and experience of the driver. It should be particularly pointed out that the electrically driven reversing mill does not increase in speed as the ingot passes out of the rolls, while the steam engine, unless carefully handled, will race and run away.

Three-High Mills.

The authors have selected the electrically driven blooming mill as an example, and space unfortunately does not permit the discussion of the modification of the Ward-Leonard system to suit the requirements of plate mills and finishing mills. It is, however, important to mention that there is an increasing tendency in Europe to use the Ward-Leonard system for the driving of three high finishing mills, instead of a continuous running motor and flywheel coupled to the mill. The reason for this is that the Ward-Leonard system enables a much greater output to be obtained from the mill, because the bars may be entered at a low enough speed to prevent damage being done, and, as soon as the rolls have gripped the bar, the speed is run up to a maximum and diminished again so that the bar leaves the rolls at a reasonably low speed.

As a 100-lb. rail rolled from a 4½-ton ingot finishes about 90 ft. long and bulb angles and channel often finish 200 ft. long, the saving in time which may be effected can be appreciated, and as this enables the material to be finished much hotter, the work done in rolling, and consequently the cost of power, and reduced. Where a three-high mill is driven on the Ward-Leonard system it is found that there are far fewer broken rolls than when it is coupled to a continuous running motor and flywheel. These advantages are found in Europe to outweigh the increased capital cost of the plant.

Safeguarding the Human Factor.—"Hereafter all promotions of whatever character will be made only from the ranks of those who do not indulge in the use of intoxicating drinks. The heads of departments and the foremen will be expected to enforce this order in advancing their men." This official order, recently posted in the mills of the Carnegie Steel Co., in the Youngstown district, is in line with the elaborate system of that company to maintain the efficiency and safety of the men of its mills. It illustrates the effort of large employers to reduce the fallibility of the human element in industrial accidents. An unsteady hand or a confused brain, where alertness is required, may mean the injury not only of the one thus affected, but serious disaster to his fellow-workmen as well.—Ex.

Jig Bushing Design, Construction and Application

By F. Scriber

THE proper bushing to use for guiding a drill, reamer, counterbore, or tap when making jigs is a question that comes up on almost every job, and it is the purpose of this article to show some of the combinations which give good results. In addition, tables of bushings and locks are also included as a guide to the general run of these tools. These bushings are sometimes carried in the cover of the jig, the main frame of jig, or both, and are used as shown by Fig. 1, for guiding a plain drill while making a hole, or are used in numerous combinations, of which Fig. 2 is an example.

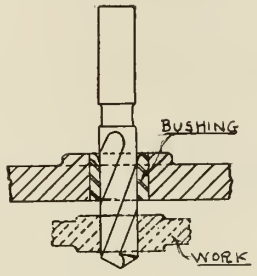

FIG. 1. METHOD OF GUIDING DRILL IN PLAIN BUSHING.

In the latter, (A)—is a drill with a stop collar used for spotting the hole as shown and is a running fit in the slip bushing (B). The next view shows the slip bushing removed and a drill (C) being used to drill a hole, the same following in line with a spot. Another slip bushing (D) is shown in place, while a hole is being reamed by reamer (E) which is a running fit in the bushing.

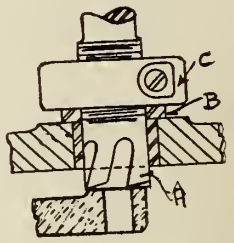

FIG. 4. COUNTERBORE WITH STOP COLLAR USED IN LINING BUSHING.

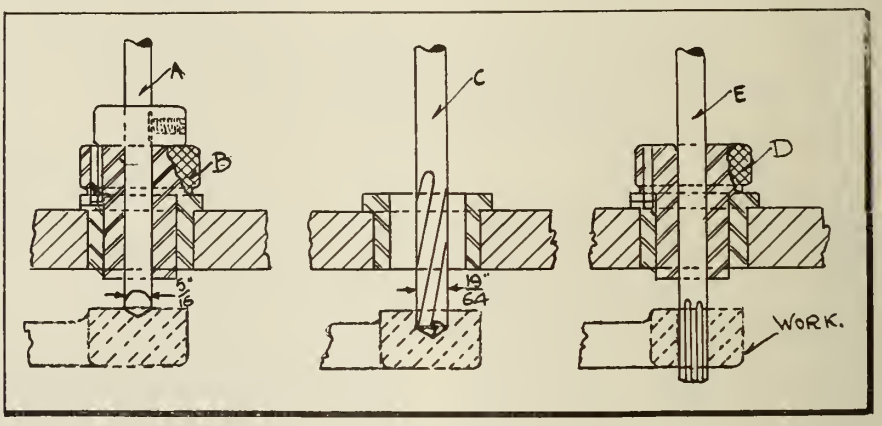

FIG. 2.

Spot drill with stop collar used in slip bushing. Reamer drill guided only by spot. Reamer used in slip bushing.

An example of the spot drill and tap method of using bushings is shown by Fig. 3. There is but one bushing in this case which is a collar head bushing with a hole of diameter equal to the outside diameter of the tap, while the spotting drill (A) is of the same diameter as the

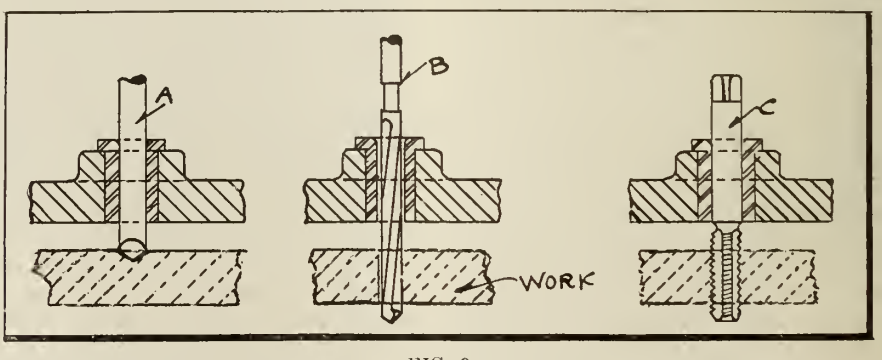

FIG. 3.

Spotting the hole. Drilling the hole. Tapping the hole.

tap outside and is followed by a tap drill (B). The hole is afterwards tapped at (C). The use of a counter bore or facing tool with a stop collar on it

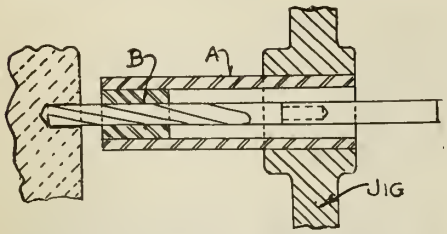

FIG. 5. EXTENSION BUSHING USED WHERE LONG REACH IS REQUIRED.

is shown by Fig. 4, where (A) is the facing tool, and bushing (B) with collar (C) is shown down flush on the bushing head, being used as a stop.

BUSHING LIST.

LOCATION	No. REQ.	STYLE	HOLE A	HOLE LAP FOR	LENGTH	SLOT IN HEAD	NUMBER

FIG. 6. BUSHING LIST.

It sometimes happens in the construction of jigs that the distance from the frame of the jig to the work is quite

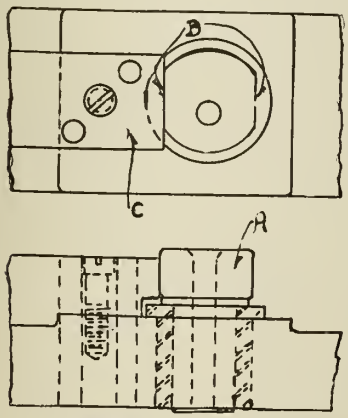

FIG. 7. METHOD OF LOCATING ECCENTRIC BUSHING.

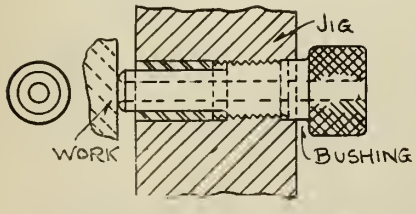
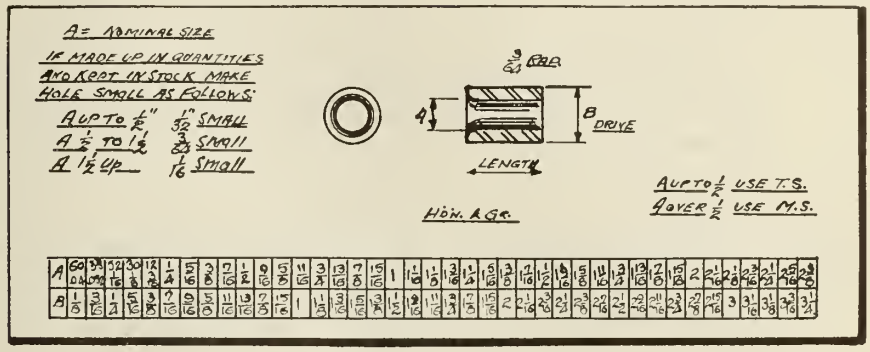
a distance, and it therefore becomes necessary to use an extension bushing similar to that shown by Fig. 5, which





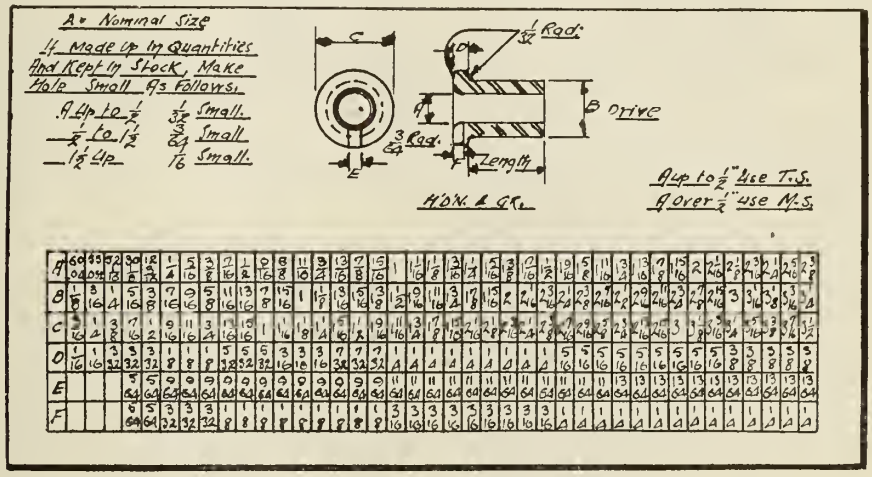


FIG. 8. SCREW BUSHING USED ONLY WHEN NO OTHER WORK-HOLDING METHOD IS AVAILABLE.

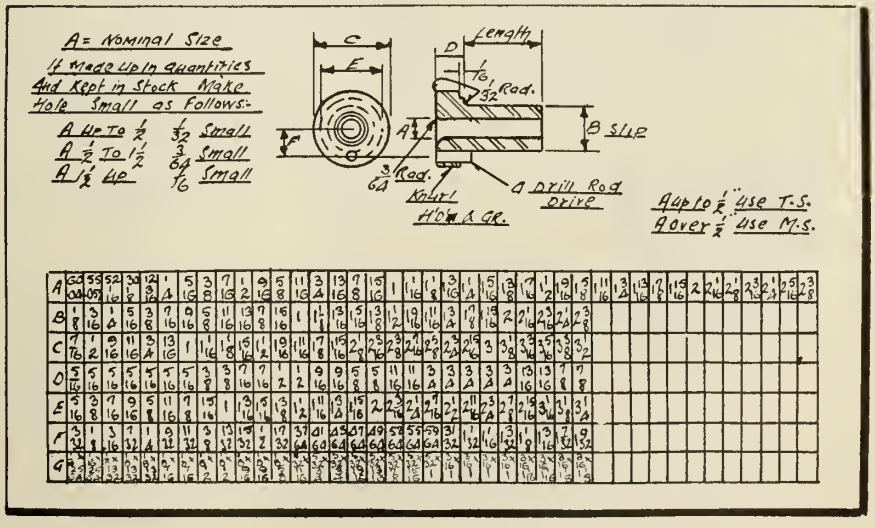
consists of two bushings (A) and (B), the long one (A) being used to carry the short one (B) up near the work where the drill should always be supported. In connection with these bushings, styles I, II, III, show proportions



STYLE I. PLAIN BUSHINGS.

which are good practice. Style I refers to plain bushings; style II to collar head bushings, and style III to slip bushings.

STYLE II. COLLAR HEAD BUSHINGS.

All are made from tool steel up to half inch, and from machine steel over half inch, although tool steel is often used for all sizes.

STYLE III. SLIP BUSHINGS.

To use these lists it is necessary to refer to the bushing list Fig. 6. This is placed on the drawing of the jig. The first column gives the location by number of the bushing in the jig, the second column gives the number of bushing required, the third column the style of bushing, whether one, two or three as shown by the lists, the fourth column (A) corresponds to a similar dimension on the bushing lists, and is the governing factor from which all other dimensions are taken. Column five gives the size to which the holes are lapped; and column six the length of the bushings, this being purposely omitted in the

tables as it varies according to conditions. Column seven specifies yes, or no, to the question, "slot in head," which is explained later, and the last column is for designating the bushing

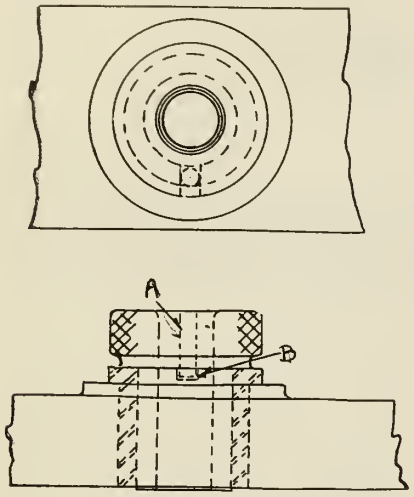


FIG. 9. METHOD OF LOCKING BUSHINGS SHOWN IN THE TABLES.

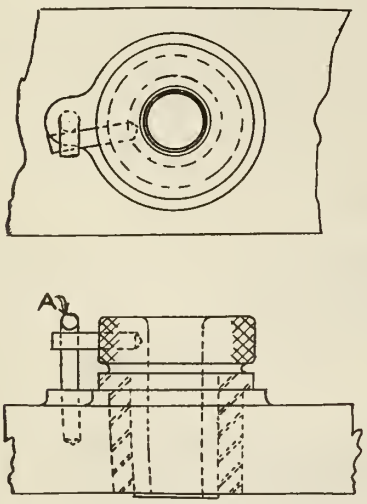
in its proper connection with the jig by a number.

Another method which can be used for drilling two eccentric holes is shown by Fig. 7, and consists of a plain slip bushing (A) which has the hole that guides the drill placed off centre and is flattened off on the sides at (B) to butt against a block for locating (C). The manner of using is obvious from the sketch, as the first hole is drilled with the bushing in the position shown, while, to drill the other hole, the bushing is turned half way round and the flat at



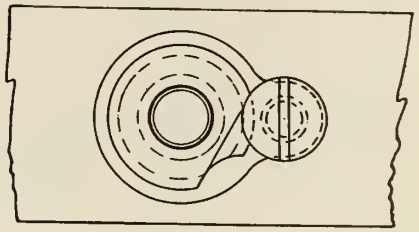


FIG. 10. BENT PIN METHOD OF LOCKING BUSHING.

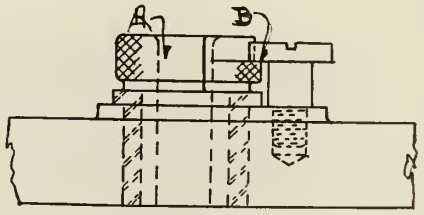
the opposite side placed against the block to drill the hole. This method is often used to make a slot, as, when the two holes are drilled, the metal between the holes can be filed or broached away to make the slot. The last bushing shown is a screw bushing Fig. 8. This is mostly used to hold work in place and guide the boring tools at the same time. It is made to screw down on the work in a manner which can be readily seen from the illustration.

Next in importance to the correct bushing to use for the best results is a suitable lock to hold slip bushings in place, and while these vary considerably, four good locks are here shown. The first of these Fig. 9 is the style of lock which is shown in the tables of bushings illustrated and by referring to the sketch, Fig. 9, the manner of application will be apparent. The pin (A) in the slip bushing, fits into the slot (B) in the fixed bushing; the slip bushing is thus prevented from turning with the drill or whatever cutting tool is being used. This lock is quite satisfactory where the metal being cut is cast iron, but, with steel or other metal which gives a long stringy cut it is not reliable, as there is



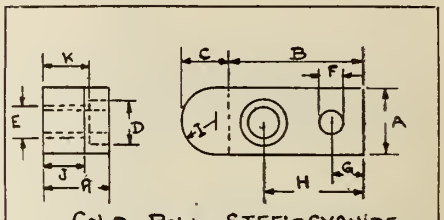


FIG. 11. BUSHING LOCKED IN PLACE BY STUD.

nothing in its construction to prevent the slip bushing from being pushed out.

In the bushing list, Fig. 6, reference was made to a column in which it is necessary to answer "yes" or "no" to the question, "slot in the head" of the bushings style II. This means that if the bushings are to be used with slip bushing style II, and the style of lock mentioned above. they will require a slot, and the column will require the answer yes; its opposite, of course, being no. For the other style bushings the column is left blank or has a dash placed

FIG. 13. STANDARD LOCKS FOR USE WITH SLIP BUSHINGS.

in it, this being equivalent to non-recognition.

A good lock which can be used when machining any metal is shown by Fig. 10, and consists of a bent pin (A) placed in the jig to hook over a plain pin in the slip bushing in the manner shown; the bent pin being placed on the side of the plain pin where it will resist the action of the drill. The use of a stud screw for locking a bushing in place is shown by Fig. 11. This is used to hold both the bushing from turning and from coming out of the jig, the bushing head (A) being cut to receive the screw at (B).

A somewhat more expensive form of bushing lock but a very good one is

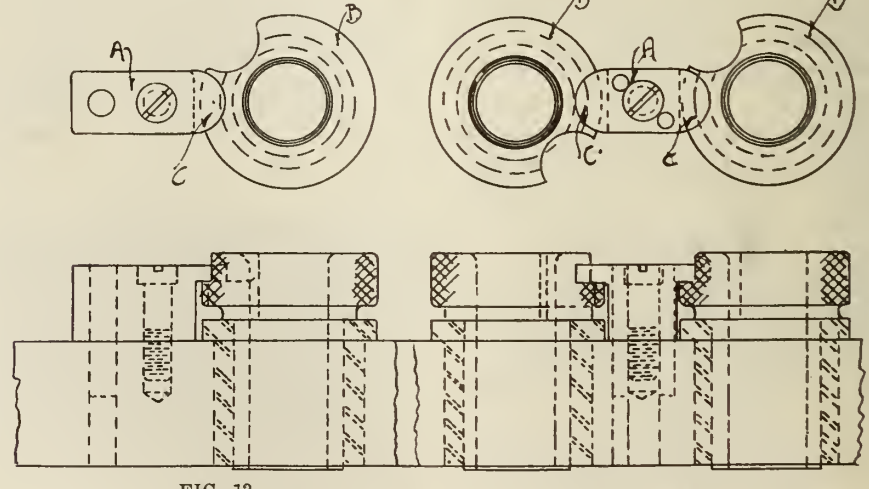

FIG. 12.
Method of locking single bushing with block. Two bushings locked with one block.

shown working under two conditions in Fig. 12, while a table of proportions for same is shown by Fig. 13.

Safety Provisions Relative to Transmission Machinery—I.

By W. Sydney Smith.

An official report by the Inspector for Dangerous Trades in England, regarding fencing and safety precautions for transmission machinery, has been issued. It explains the structural and administrative safeguards with regard to the several parts of transmission machinery which experience shows to be needed for the protection of persons employed where such machinery is used.

IT is a dangerous fallacy to assume, as is often done, that slow-running shafts, or shafts of large diameter, are free from danger and need not be safeguarded. Every shaft is required by the Factory Acts to be securely fenced, irrespective of its speed or size, unless it be equally safe by position or construction as if it were fenced. Unfenced smooth shafting of 12 ins. in diameter and shafts running at less than 26 revolutions per minute have been responsible for fatalities. The following rules should apply to horizontal, vertical and oblique shafts:—

(1)—Shafts less than 6½ ft. above the floor level should be securely fenced.

(2)—Shafts more than 6½ ft. above the floor level should have those parts securely fenced which are less than 6½ ft. from any point (work bench, platform, shelf, cupboard, machinery, boiler, plant, pile of goods, ladder or other structure, to which workers may need occassional acess for such purposes as lubrication, cleaning, manipulating belts, or other work of maintenance of transmission machinery; lime-washing, painting, electric wiring, cleaning, opening or shutting windows, or any occasional work other than the work of maintenance of transmission machinery, except where the shaft is stopped at the time any worker approaches within 6½ ft. of it. or the shaft is moving at less than six revolutions per minute at the time any worker approaches the transmission machinery for the purpose of adjusting belts, and due provision is made (by signals or otherwise) for prompt stoppage at the first sign of danger.

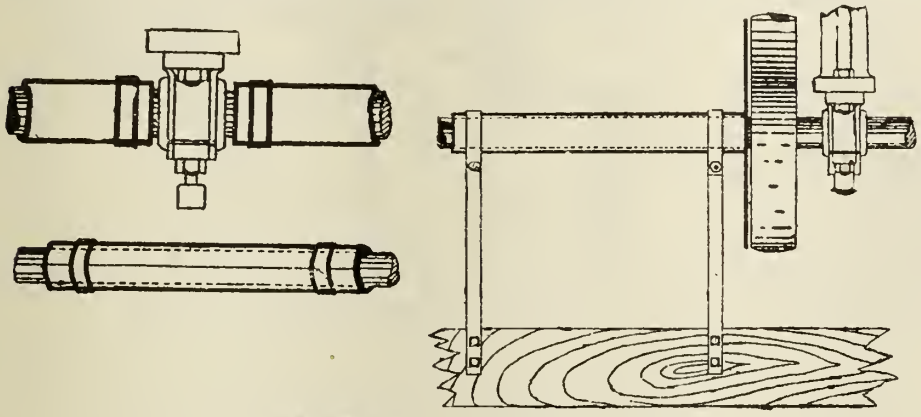

FIG. 1. SHEET METAL O R MILLBOARD TUBES.

These rules are embodied in the proposed regulations requiring shafting and other parts of the transmission machinery "within reach" to be securely fenced, if in motion, and the phrase "within reach" is defined as meaning "within a distance of 6 ft. 6 ins. in any direction from any spot on which any person employed or working may have to stand or pass at any time, either in the course of his employment or incidentally thereto."

Measuhement in an upward direction only will not suffice. Dangerous transmission machinery may be "within reach" in a horizontal or even downward direction from the working place of a person employed—for example, it may be near or below the level of the floor on which he has to stand; or he may have to work at the edge of a pit or on a ladder, with risk of falling into unfenced transmission machinery below.

Although the definition makes no exception for an intervening fence of any kind, even a floor or wall, no difficulty can arise in practice since the requirement of secure fencing may be already met.

Type of Fencing.

The type of fencing needed varies with the position and arrangement of the transmission machinery, but shafts are usually fenced, either by complete or partial casings, consisting of fixed or loose sleeves, or by guard rails so placed as to prevent access. Tubes of sheet metal or mill board, Fig. 1, sheet metal troughs, Fig. 2, and wood casings, Fig. 3, make excellent guards. These may be attached by suitable brackets to such supports as pedestal bearings, hangers, wall-lboxes, overhead beams, walls or flooring.

Wire netting is sometimes similarly used, but is less cleanly than complete casings of sheet metal or wood. Millboard tubing, somewhat larger in diameter than the shafting, may be slipped over the shaft as a loose sleeve, which will revolve when the shaft is in motion, but will stop immediately if a person comes in contact with it. Millboard tubes are made of varying lengths, in halves or split on one side. The parts can be readily fastend together by means of thin wire or metal clips which should be free from projections. Loose metal sleeves are often similarly used

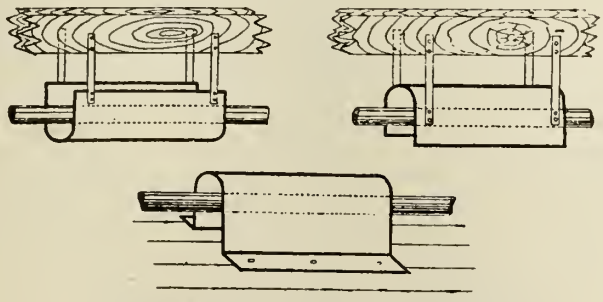

FIG. 2. SHEET METAL TROUGHS FOR PROTECTING REVOLVING SHAFTS.

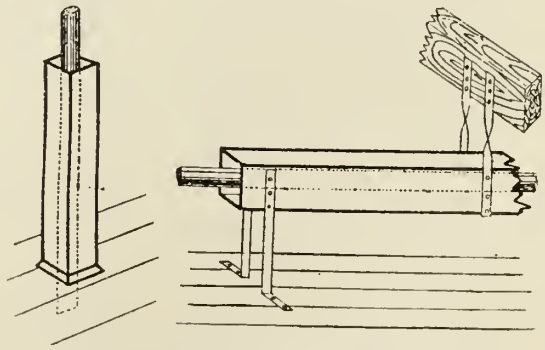

FIG. 3. WOOD CASINGS FOR PROTECTING REVOLVING SHAFTS.

for fencing shafting and projecting shaft ends.

When shafting is fenced with partial casings, care should be taken that the revolving shaft is covered sufficiently by the casing. Many accidents have occurred on shafts protected on two or three sides, only, leaving the shaft exposed in one or more positions. Shallow partial fencing, such as a trough or single board placed under, over, or adjacent to shafting, is dangerous. For this reason, complete casings are preferable to partial guards unless deep troughs of wood or metal are used.

In some instances, owing to the number of pulleys upon low lines of shafting, as in flour mills, saw mills, engineering factories, and similar works, the shafts cannot be encased. Guard rails are then necessary. The rails should not be too wide apart and the space between shaft and rails, whenever the diameters of the pulleys or the positions of the driving belts permit, should be about 12 inches. If it exceeds this, a person may enter within the space, and if less than this, accidents may happen through contact with the shaft by clothing or materials, or by persons falling against the rails.

In clothing factories, where sewing machines are generally driven by low shafting under the machine benches, the shafts and pulleys are often fenced by rods of iron or by fixed boards, and occasionally by hinged boards. The latter are dngerous, as there is always the chance of the workers throwing back the guard and coming in contact with the shaft. Where rails are used these should be sufficiently strong to resist bending if used as foot rests.

Care is necessary as to position of the guards and spacing of rails and boards to allow, with safety, the adjustment of driving bands and the necessary cleaning under benches, but at the same time to avoid the possibility of the hair being caught. Such accidents generally occur when a worker with loose hair is sweeping under a bench or picking up some object which has fallen on the floor in the vicinity of the shafting. It is usually found either that the guards were fixed originally too far apart, or that a rail had been bent downwards, leaving sufficient space for the head to approach the shaft and the hair to become entangled. A space of 8 inches between the floor and lowest guard, with spaces not exceeding 6 inches between the higher rails or boards, will not interfere with cleaning or manipulation of belts, and will almost entirely remove the risk of accident.

In the latest type of sewing machine benches, the machines are driven from a shaft, fixed a few inches below the bench, and completely encased in planished steel tubing; while the shaft is directly driven by an electric motor co-axial with the shaft. The fronts of the pulleys and bands driving the machines are fenced by cast metal grids. In general, where females are employed, greater care is needed as to the fencing of transmission machinery in order to avoid accidental contact of the worker's hair or clothing with revolving parts; complete encasing of shafting, with protection of pulleys by side plates, as shown in Fig. 1, is preferable.

Whenever it is necessary to cross low lines of shafting fenced by rails, there should be gangways or steps at suitable intervals so as to fence the shaft, with hand rails on either side of these crossing places (Fig 4). Where the shafting is high enough to allow passage underneath, but less than 6½ ft. from the floor level, the shaft should be completely encased at the passage way (Fig. 5).

High shafting in motion must be approached from time to time by engineers, greasers, beltmen and other persons employed in oiling, cleaning, adjusting belts and similar work of maintenance. Where space permits, there should be an overhead gangway or service platform, sufficiently near the shafting to admit of the necessary work being done in safety, and yet at such a distance as to prevent contact with transmission machinery in motion. The platform should have guard rails to a height of 3 ft. and a skirting board to prevent the worker falling under the rails or fall of tools on persons below. Failing overhead gangways, the approach may be made by a safe type of ladder, but in such cases there is always risk of accident unless the shafting in the vicinity be fenced,

High shafts are often permanently encased for about 2 ft. on either side of each bearing, the casings being fixed by suitable brackets to the bearings or hangers. Ladders are sometimes provided with an inverted trough, which rests on the shaft, and so fences the portion temporarily. These may be used where there is ample space between pulleys, couplings and bearings. If there be lubricators, or self-lubricating bearings, oiling can generally be done at rest, but replacing of belts on pulleys is impossible in many cases unless the shafting and pulleys are moving. With various types of belt mounters this operation can be done in safety from the floor level at the ordinary working speed of the shafting.

Where pulleys are close together, fencing of the shaft is often impracticable, and if the worker approaches unfenced transmission machinery in motion to adjust belts, in addition to contact with the revolving shaft, there is always the danger of contact between belt and pulley, or belt and shaft. Hence, in cases where approach to unfenced shafting is necessary, it is imperative that the speed of the shafting be previously reduced to a safe limit.

Severe accidents have occurred on shafting moving at only 9 revolutions per minute, and a fatal accident on a shaft moving at only 5½ revolutions per minute; but a speed not exceeding 6 revolutions per minute may be considered safe for the dangerous operations of manipulating belts by hand on transmission machinery in motion, provided due provision is made by signals or otherwise for prompt stoppage at the first sign of danger.

PUNCHING HOLES IN LIGHT PLATE.

By J. W. Ross.

IN shops not equipped with a power punch, or where the punch is situated a long way from the work, it is a common practice to punch holes in light plate by hand over a hardwood block or a nut. Placing the nut in exactly the right spot is a matter of some difficulty, especially if the hole to be punched be at some distance from the plate edge.

At one time, the writer had a number of 5-16 holes to punch in a plate 3-32 inch thick. This was a repeat job, and as the holes were not spaced exactly alike in each piece it was necessary to mark them off every time. The job was being done by piece work, and as the power punch was a long way from the place where the work was being carried out, much time was wasted taking the plates to it each time. To overcome this drawback, the writer devised the jig shown in Fig. 1, by means of which the job could be done in a few minutes with a great saving of time and money. The jig was made in less than an hour, during a lull in the work.

A die was procured from the boiler shop, and around it was bent a piece of flat iron, 1 x ¼ inch. The iron was given a half-twist, as shown at (A) in Fig. 1, and was bent over so as to bring the upper bar in line with the die. A hole was then drilled in this upper bar to gauge the punch to the die. For punching the hole, a plate-marking teat punch was used, as shown at (B), Fig. 2. It was found an advantage for some jobs to remove the teat by grinding, and thus have a flat surface at the end of the punch, as shown at (C). A couple of hammer blows on the head of the punch quickly forces a hole through the plate, while a little oil greatly facilitates the work. After the hole is punched, a light blow on the side of the punch allows the latter to be readily stripped from the plate. Smaller holes may be punched by changing the die, an operation that may be quickly accomplished by means of the wing bolt shown in Fig. 2. If unable to obtain a marking punch, an ordinary drift pin may be ground to the desired size and shape on an emery wheel and afterwards tempered. This makes a very effective punch.

A more elaborate jig is shown in Fig. 3. The part containing the punch holes and dies is of tool steel, while the bent portion may be machine steel welded on. With this device, several sizes of holes can be punched without changing the dies. Heavier gauges of plate may be punched by using a punch with a handle, or by holding the punch with tongs, an assistant striking the punch with a light sledge.

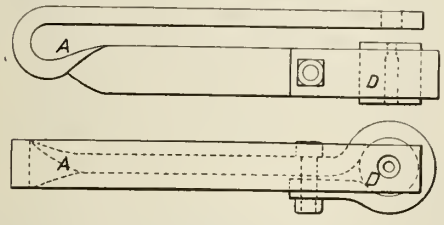

FIG. 1. PUNCH FIXTURE FOR USE WITH BUTTON DIE.

As in the case of power punches, the punch should be slightly tapered as shown, to permit of clearance. The die is similarly tapered to allow the punchings to fall through. If the punch (B) be used for the fixture shown in Fig. 1, the one-sized guide hole can be used with all sizes of dies. It also has the advantage of not being so easily broken.

COLLET CHUCK OPERATED BY COMPRESSED AIR.

By H. C. Dunbar.

OF late years compressed air has been used in several machine shops to operate various forms of quick opening and closing chucks specially designed to assist in the rapid production of standard machine parts. The purpose of this article is to describe how a simple and useful collet chuck is operated by compressed air.

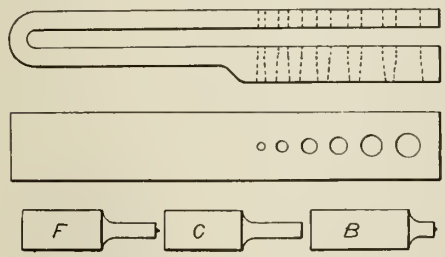

FIG. 2. PUNCH FIXTURE FOR DIFFERENT SIZE HOLES.

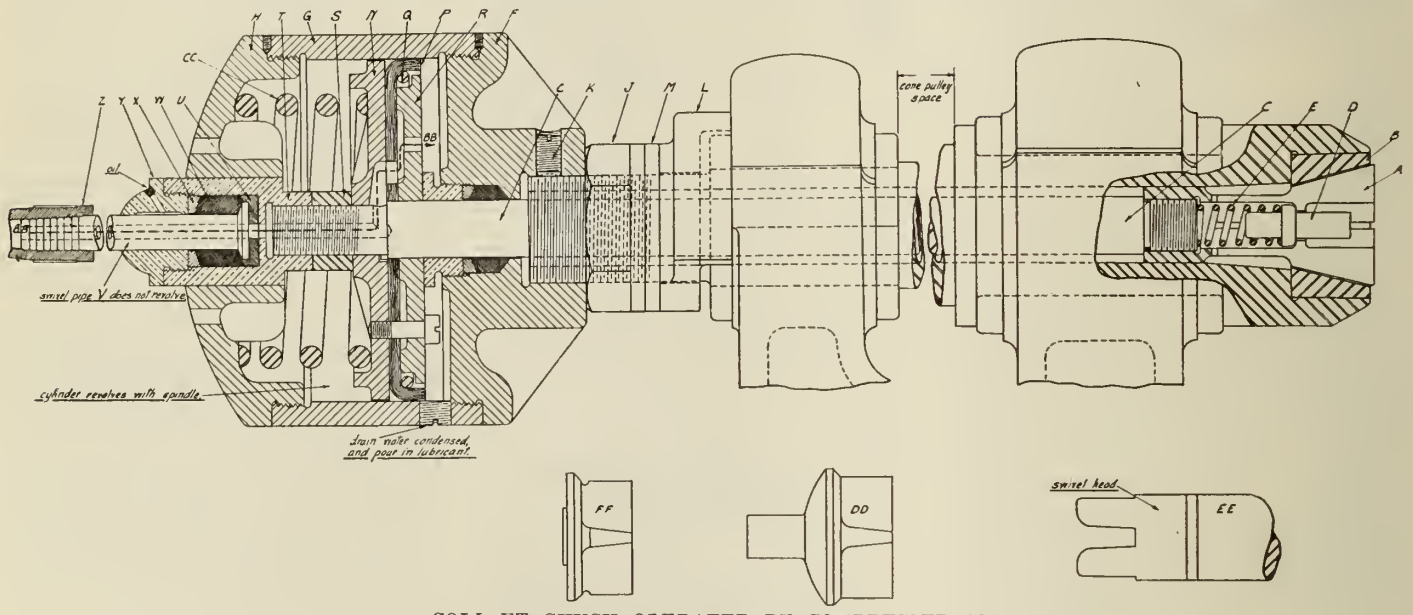
With reference to the accompanying sketch, the pull collet (A) is made of tool steel (hardened); the head is tapered on the outside to fit the tapered nose ring (B) of tool steel (hardened), which is pressed into the end of the lathe spindle. The bore of the nose ring and the outside of the collet head are ground after hardening to an angle of 14 degs. The back collar of the collet is ground on the outside to fit the bore of the lathe spindle; the collet is also threaded inside, as shown, to suit the thread on the pull rod (C), and is bored from the back to take the plunger (D) and the coil spring (E). The front end of the collet is bored to suit the article to be machined. The collet is turned down between the back collar and the head, and is sawn from the front, with two cuts at right angles, to within ¼ in. of the back collar, so that the four segments thus formed are free to close upon the work, or to release the work, as the chuck is operated.

The cylinder is made of cast iron in three parts—the pressure head (F), the barrel (G), and the non-pressure head (H). These three are screwed together, as shown, and a dowel is screwed into each joint to prevent the parts from unscrewing when the lathe is reversed. The pressure head (F) is screwed on to the lathe spindle, and is secured by a jam nut (J) and by one or two tool steel set screws (K) with cupped points. The jam nut (J) acts also as a thrust nut to take up the end play of the lathe spindle. Between the thrust nut and the thrust cap (L) there runs a loose ring of hard fibre (M). This eliminates much of the wear which would be caused by the friction of the steel thrust nut on the thrust cap.

The piston is made up of four parts—the cast iron piston head (N), the cupped packing leather (P), the packing leather expander (Q), and the cast iron piston follower (R); (N), (P), and (R) are bound together by four machine screws. The expander (Q) is loose between the leather and the follower. It is made of round steel wire, rolled to form a ring slightly larger in outside diameter than the inside diameter of the leather; a small piece being cut out of the ring so that when contracted and placed inside the cupped leather the ring will expand, when released, and press the leather against the wall of the cylinder, in this way preventing the compressed air from passing the piston. The ring is assisted in its office by the compressed air which, when admitted to the front end of the cylinder, forces the leather outwards against the cylinder wall. The piston is secured to the pull rod (C) by the nut (S), which is locked by the stuffing box (T).

The stuffing box (T) is free to move

lengthwise in the non-pressure head (H). Inside the stuffing box is a fibre washer (U), against which butts a steel swivel pipe (V). The graphite packing (W) is held in place by the ring (X) and the nut (Y). To the swivel pipe is attached a short length of air hose (Z) bent "L" shape to allow for the straight-line motion of the piston. The swivel moves back and forward with the piston, but does not revolve, and the hose is stiff enough to overcome the twisting tendency of the swivel caused by the friction of the packing. Compressed air enters the cylinder in the direction of arrow (AA), (BB), while the supply of air is controlled by an ordinary straight stop-cock with a vent hole in one side, so arranged that when the air supply is cut off the exhaust from the cylinder escapes through the vent holes. In order that the chuck may act promptly, it is well to have a reservoir of about four times the capacity of the cylinder placed in the air line as close to the controlling stop-cock as possible.



A stuffing box with graphite packing in the pressure head (F) prevents the empressed air from escaping past the pull rod. A coil spring (CC) forces the piston to the end of its stroke when the air pressure is released from the cylinder.

A chuck similar to the one described is working successfully on the turning of small four feathered valves on a turret lathe. The lathe spindle having been started up, a valve in its rough cast form (DD) is placed in a swivel-headed holder (EE) held in the lathe turret. The turret is then run up—towards the headstock—against a stop. When the shank end of the valve will have entered a set distance into the collet and pushed back the plunger (D) compressing the coil spring (E), the compressed air is then admitted to the cylinder. It forces the piston back, the coil spring (CC) is compressed, and the collet (A) being pulled backwards into the tapered nose ring (B), closes upon the valve shank with a powerful grip. The valve commences to revolve with the spindle, as does also the swivel head of the valve holder. The turret is now run backwards until the holder is clear of the valve, and the valve is now ready to be machined.

The last of the turning operations is cutting the valve from the shank by means of a parting tool held in the cross slide of the lathe. When this has been done, the valve shank is left in the collet. The air pressure is now turned off from the cylinder, and the pressure in front of the piston being released, the spring (CC) forces the piston to the end of its stroke. The collet is pushed outwards from the nose ring, and spreading out, it releases the valve shank, which is ejected by the force of the spring (E) acting on the plunger (D). The collet is now ready to receive another valve. The figure (FF) shows the valve in its finished turned form.

It was found that, as the valve was chucked on the instant, with the lathe spindle running, and on account of the extra operations which were done at one chucking, the cost of turning these valves was reduced by about 20 per cent.

While this article deals with only one form of air chuck, there are many others of different form in successful operation. Such a chuck can be used with profit on the production of machine parts in a great variety of cases, provided that the output required is large enough to justify the initial cost of the apparatus. The cost of operating one of these chucks in a factory where compressed air is already used is negligible.

COLLET CHUCK OPERATED BY COMPRESSED AIR.

IS THE AVERAGE MAN A POOR OBSERVER?

HOW many men can tell the number of spokes in a carriage wheel, or the number of spokes in an automobile? Probably they have not cared to know that as a rule there is a standard number of spokes for a carriage wheel and for an automobile wheel.

You may have a friend who daily sticks a pin in his necktie with a given number of pearls or diamonds, but if you bet him cigars, he cannot tell you the number of pearls or diamonds in it—ten to one he will lose. Detectives tell us that the color of a missing man's eyes was given by his sister as blue, by his brother as gray, while his father declared they were hazel.

Many men see a thousand horses a day in the streets and yet cannot tell without looking, on which side the mane lies, and there are hundreds of others of country birth and bringing up who have never noticed one curious difference between cows and horses. In rising after lying down, a cow always straightens her hind legs first, whereas a horse rises on his front legs to a dog-like sitting position and then jumps to his feet.

There are thousands of curious things in life that our friends the magicians and fakirs, fortune tellers and clairvoyants know and make use of, but of which the average person has no knowledge, simple because he has never observed.—Ex.

Of all fretting, that is least glorious which bewails the smallness of one's sphere, the common-place character of one's work, or the lack of recognition by one's neighbors.

DEVELOPMENTS IN MACHINERY

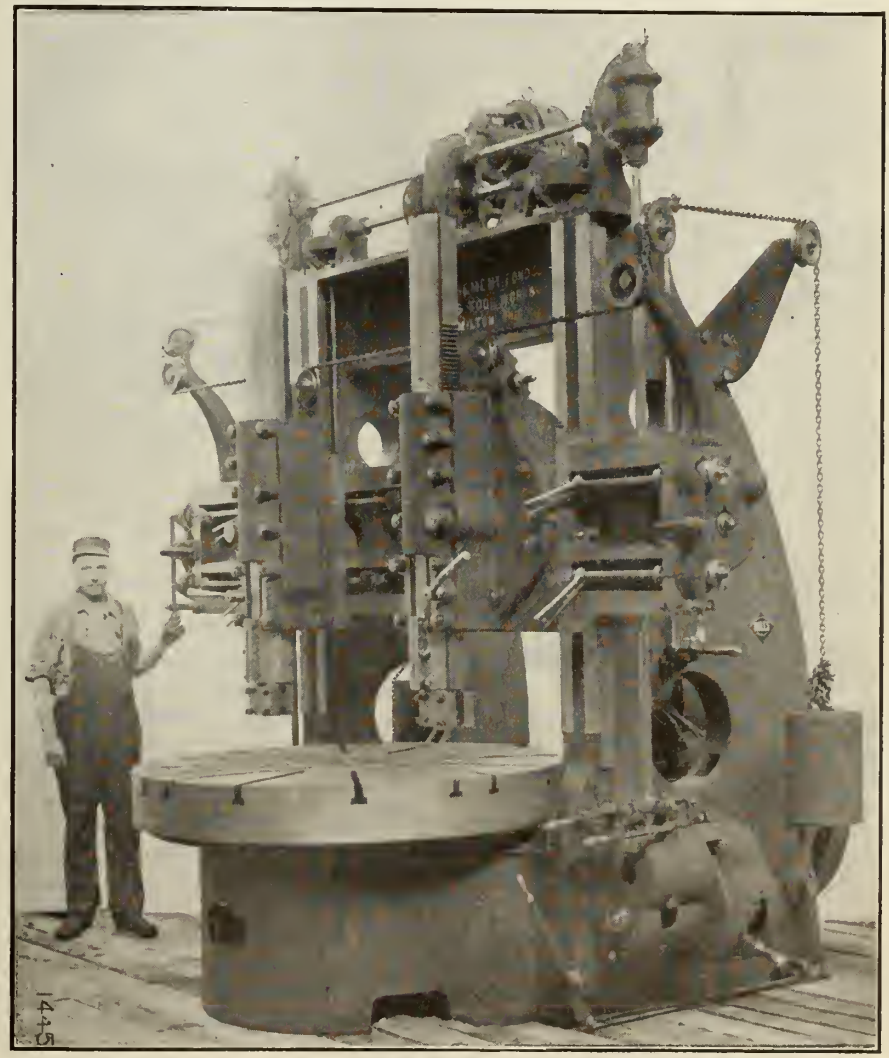
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW DESIGN BORING AND TURNING MILLS.

THE Niles-Bement-Pond Co., 111 Broadway, New York, have placed on the market a new design of boring and turning mills to meet the demands of manufacturing and other shops in the matter of high production with the accompaniment of ease and convenience of manipulation on the part of the operator.

By means of a centralized control, all changes of feed and reversal, rapid power traverse or hand adjustment of saddles and bars, also cross rail adjustment and table control are within reach from the operator's position. One lever disengages feed, engages fine and coarse feed, and operates fast traverse in either direction. A rapid power traverse to saddles and bars in either direction is provided. Hand adjustment of saddles and bars is by automatic releasing ratchets located at the sides of the saddles. The machine is self-contained, and as no part extends below the floor line, no special foundation is required. The housings are of box-girder form, double-webbed and broad-faced, without openings in front face. Cross-rail elevating screws are located between the housings. They are securely bolted to bed, and firmly tied together at the top by a heavy brace.

The table is deep, strongly-ribbed and supported by an annular bearing of large diameter running in a bath of oil. It is driven by coarse pitch bevel gear, accurately cut, of maximum diameter and wide face. The surface of table has four pairs of parallel and eight radial T slots. The table spindle is long and of large diameter, and is maintained in strict alignment by an upper and lower bearing. The former is bored out of the solid bed and fitted with an adjustable taper bush to take up wear. The lower bearing is bronze bushed. On the end of spindle is an adjustable threaded collar to prevent lifting.



The cross rail is of the 3-track type, having narrow guide at the bottom with saddle traversing screw located between the guiding surfaces, giving an ideal condition for accurately guiding saddles. The cross-rail is box girder in form, broad-faced, and of ample depth to effectually resist heavy cutting, and may be readily clamped to the housings. Power adjustment is provided.

The saddles have wide bearings on the cross-rail, accurately scraped, with provision for taking up wear by means of taper gibs. A clamp bolt is provided for clamping each saddle when bar is feeding. Swings are accurately graduated, and swivel by means of an arc worm at the top. The bars are massive steel forgings, octagon in form, scraped to a bearing on four sides, allowing for taking up wear in all directions. Bars have continuous caps, and a binder bolt is provided in the bottom of bar cap for locking the bar when saddle is feeding.

The feeds, 8 in number, are positive, continuous and reversible, and independent for each head, both in amount and direction for down, cross and angular feeding. The tool holders are steel forgings, with provision for readily clamping tools for boring, turning and facing operations. They have straight shanks and are readily removable for the insertion of special boring bars. The counterweights for each bar are attached to the same chain, but act independently, and do not pull the swings over, nor interfere with the movement of the saddles. Counterweight chain is placed at the rear of the bars to prevent interference from overhead cranes when handling work on and off the table.

Safety friction clutches located on the vertical spline shafts insure against accidents, in case heads or bars meet with obstruction when either feeding or fast traversing. All gears are guarded.

The different materials employed throughout the machine are such as to give the best conditions for strength, rigidity and wear. All shafts are of high-grade steel, and the drive is bushed throughout with bronze. Taper gibs are used to take up wear on sliding surfaces. All driving, feeding, fast traversing and elevating gears are of very lib-

MOTOR-DRIVEN, 62-INCH, NEW DESIGN BORING AND TURNING MILL.

eral diameters, pitches and faces, and steel, bronze, raw-hide and semi-steel are used with discretion to give the best conditions of strength, and at the same time, long wear.

The motor drive by direct current is by a motor of 4 to 1 speed variation, carried on a drive plate in the rear between the housings. Power is transmitted through a double run of clutch gears, giving two mechanical changes in speed, which, with the usual 16 or more speeds in the controller, gives 32 or more speeds to the table. The motor is fitted with push-button control, and a dynamic brake for table. A separate motor, located on the top brace of the mill, is furnished for elevating the cross-rail and providing rapid power traverse to bars and saddles.

Belt drive through a single pulley or alternating current motor drive by constant speed motor is through a speed box and back gear located in the rear of the mill, giving 12 changes of speed. All gears in speed box are of Cyloid gear steel, of approximately 200,000 pounds tensile strength, treated and hardened. The speed box is fitted with a hand operated friction clutch for starting and stopping the table, while the brake provided is controlled by the same hand lever at the right hand side of the mill which operates the clutch. A separate motor, located on top brace of the mill, is furnished with A. C. drive for adjusting cross-rail, and providing rapid power traverse to bars and saddles. Belt-drive machines are built on the convertible plan, and may be readily changed to motor drive.

The size ratings of the different machines are 44 ins., 53 ins., 62 ins., and 73 inches; with actual swing of 44½ ins., 54 ins., 63 ins., and 74½ ins., respectively. For the foregoing sizes, the maximum height under tool holders ranges from 30 to 40 ins., the maximum height under cross rail from 36 to 46 ins., the bar travel from 20 to 30 ins., the diameter of table from 42 to 68 ins., and the horse power of motors from 7½ and 1½ to 12½ and 2.

DERIHON PORTABLE HARDNESS TESTING MACHINE.

THE purpose of the Derihon Portable Hardness Testing Machine is for testing the hardness of metals according to the Brinell method (making an impression with a 10 mm. ball under a pressure of 3,000 kgs.)

Fig. 1 shows the machine ready for the test with the lever raised and resting on the shaft. The piece to be tested is placed on the table of the machine, which is then raised until the piece is in contact with the ball. This done, the lever is pulled slowly over so as to give a progressive pressure (the pressure is registered by a small manometer), until 3,000 kgs. are applied. When this figure is reached, the lever is slowly returned to its former position and the test is completed. Under normal conditions it is usually sufficient to move the lever through an angle of 45 degrees to obtain the required pressure of 3,000 kgs. With each machine is furnished a small piece of steel in which a standard impression has been made, the size of the diameter being stamped on same. This standard piece is of BND steel, an air-hardening chrome-nickel steel. The accuracy of the machine can be easily controlled by making an impression alongside the standard impression.

The construction of the machine is based on the principle of elasticity of the frame, which for this purpose has been given the shape of a horse-shoe, as the power produced by the pressure of the ball on the test piece has a tendency

DERIHON PORTABLE HARDNESS TESTING MACHINE.

to open the frame to a certain degree in proportion to this power, the shape of the frame has therefore been specially considered in order to have it as elastic as possible.

The pressure exerted of 3,000 kgs. does not change the resistance or elasticity of the frame, and even pressures of 3,000, 4,000 or 5,000 kgs. do not work it above 10 kgs. per sq. mm. (14,423 lbs. per sq. in.). Under these conditions, repeated tests even in large numbers do not alter the calibration of the machine.

The deflection of the frame being relatively weak (1 to 1.5 mm.), a register, the construction of which resembles a metal manometer, is installed in the hollowed-out part. By means of a needle and graduated dial, the deflection and, therefore, the pressure exerted on making the test can be quickly and easily read.

To adjust the machine, it is only necessary to open the case enclosing the mechanism above the frame, and should it get out of adjustment, a comparison should be made on the standard piece. When an impression of the same diameter has been made, the needle is brought over the figure 3,000 by means of a small adjusting screw. This adjustment, however, should, it is claimed, only be necessary through some accidental cause independent of the operation under normal usage.

The machine is being placed on the market by H. A. Elliott, 507 Majestic Bldg., Detroit, Mich., and is furnished in a neat portable case.

PUMPING PLANT NUISANCE.

"INASMUCH as the pumping of water is necessary for municipal purposes, the case, I think falls under the Judicature Act, empowering me to refrain from granting an injunction and to substitute damages."

Thus, has Mr. Justice Middleton given judgment at Osgoode Hall against the City of Toronto in favor of Vaux Chadwick and Jessie D. Chadwick, Poplar Plains property owners, who sued for $5,000 damages and an injunction restraining the city from operating certain electric pumps at their high level pumping station.

Mr. Justice Middleton directs that the damages be assessed by the Master-in-Ordinary, unless the parties agree upon another referee and suggests that if the evidence be taken before him, he will assess the damages himself.

The eight electric pumps in question were installed in 1912 and, instead of the comparatively slow motion of the reciprocating steam pumping engine they operate at a speed from 721 to 750 revolutions per minute. The result is a sensible vibration and a continuous humming noise, which varies in intensity on account of the pumps not being run in unison and at a uniform speed.

The city has done much to minimize the noise and vibration and the condition to-day is nothing like as serious as it was before a new and different diffusion ring was substituted to the pumps. A nuisance still exists, however, and it is held that the adverse conditions are more likely to be increased by the addition of more pumps to the plant than lessened by any further improvements or changes to the pumps.

The decision of this case establishes precedent, and it is expected that others in the neighborhood will now institute actions to secure similar damages for the depreciation of value of their property.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

Question.—A steam boiler 16 feet long and 40 inches in diameter, is made of material ½ inch thick, and carries a pressure of 80 pounds per square inch gauge. What is the stress in the shell-plate?

Answer.—The total pressure tending to disrupt the shell would be the total pressure on the longitudinal cross section, which is $16\times12\times40\times80 = 614400$ pounds.

This pressure is distributed over twice the cross sectional area of the plate, or a surface equal to $16\times12\times2\times\frac{1}{2} = 192$ square inches. Stress in shell plate is,

$$\frac{614400}{192} = 3{,}200 \text{ lbs. per sq. in.}$$

therefore,

* * *

Question.—What width of double-ply leather belt would be required to transmit 176 horse-power from a 7-foot pulley at 96 r.p.m.?

Answer—Using formula $w. = \frac{H.P.\times300}{V}$

In which

w = width of belt in inches.

H.P.= horse-power transmitted.

V = velocity of belt in feet per min.

300 = a constant for double belts.

V = circumference of pulley × r.p.m. or

$$V = 22\times7\times96 = 2112 \text{ ft. per min.}$$

$$\frac{}{7}$$

Then $w = \frac{176\times300}{2112} = 25$ inches, or say a 26-inch belt.

* * *

Question.—A motor running at a speed of 600 r.p.m., drives a fan through a counter shaft. A 10 in. pulley on the motor drives to a 28 in. pulley on the countershaft which, in turn drives a 12 in. pulley on the fan from a 56 in. pulley. Find the speed of the fan.

Answer.—Drivers are 10 in. and 56 in. Driven are 28 in. and 12 in.

Speed of fan, therefore, is

$$\frac{10}{28}\times\frac{56}{12}\times600 = 1000 \text{ r.p.m.}$$

* * *

Question.—What should be the thickness of a 10 in. cast iron water pipe to carry a steady pressure of 300 pounds per sq. in.

Answer.—Using a factor of safety of 20,000 6, the working stress would be $\frac{20{,}000}{6}$

Pressure tending to disrupt pipe is $\frac{10\times300}{2} = 1500$ pounds.

Area of metal necessary to resist this is $\frac{1500}{20000}\times6 = .45$ sq. in.

As we are considering a section 1 in. long, the required thickness would therefore be .45 inch.

* * *

Question.—What horse-power boiler would be required for a good Corliss engine of 120 h.p. taking steam at 100 lbs. gauge and with feed water at 200 degs. Fah?

Answer.—An engine of this type would use about 20 pounds of steam per horse-power hour.

One boiler horse-power represents the evaporation of 34.5 pounds of water from and at 212 degs., and to reduce the above conditions to this base the factor of evaporation is used, which for this pressure and feed water temperature is 1.052.

Steam used per hour is $120\times20 = 2400$ pounds.

Boiler h.p. required is

$$\frac{2400\times1.052}{34.5} = 73.18 \text{ h.p.}$$

* * *

Question.—What would be the weight of water in a cylindrical tank three-quarters filled and of the following dimensions, diameter 20 ft., and height 14 feet.

Answer.—Find volume of ¾ of tank thus:

$$\text{Volume} = \frac{3}{4}\times22\times10^2\times14 = \frac{3}{4}\times\frac{22}{7}\times3300 \text{ cub. feet.}$$

$$\text{Weight} = 3300\times62.5 = 206{,}250 \text{ lbs.}$$

$$\text{or } \frac{206{,}250}{2000} = 103\tfrac{1}{4} \text{ tons.}$$

* * *

Question. — What would be the required diameter of a mild steel piston rod for an engine 24×30 with a maximum steam pressure of 90 pounds per square inch?

Answer.—Maximum load on piston would be area × pressure or,

$$\frac{12^2\times22\times90}{7} = 40715.1 \text{ pounds.}$$

Allowable working stress is 8,000 pounds per square inch under these conditions.

Area required then is

$$\frac{40715.1}{8000} = 5.0893 \text{ square inches.}$$

Diameter of a shaft of this cross sectional area would be $2\sqrt{a\times\frac{7}{22}} = 2.54$ inches or approximately 2½ inches.

* * *

Question.—Why is it necessary to make the longitudinal seams of a boiler shell twice as strong as the circular seams?

Answer.—Consider a shell 10 inches in diameter sustaining a pressure of 100 pounds per square inch.

Stress on lengthwise seam per inch of length $= \frac{10\times100}{20}$ or 500 pounds.

Stress on 1 inch of ring seam is equal to total pressure on shell cross section divided by the length of the seam, or is equal to

$$\frac{3.1416\times5^2\times100}{10\times3.1416} = 250 \text{ pounds.}$$

Which is half that for the longitudinal seam.

* * *

Question.—What would be the approximate mean effective pressure throughout the stroke of a noncondensing engine, the steam pressure being 120 lbs. gauge, the back pressure being 17 lbs (absolute), and the point of real cut off at 1-6 of the stroke.

Answer.—Using formula $M.E.P. = \frac{.9P(1+2.3 \log. r)}{r} - .9p$

In which P = steam pressure absolute = gauge pressure + 14.7 lbs.

r = ratio of expansion.

p = back pressure absolute.

.9= indicator factor depending on quality type of the engine.

We get

$$\frac{.9\times134.7\times(1+2.3\times.77815)}{6} = .9\times17 = \frac{121.23\times2.789}{6} - 15.3 = 41.05 \text{ pounds}$$

per sq. in.

APPRENTICE INSTRUCTION.

THE dividend-paying capacity of apprentices depends very largely upon the speed with which they absorb a working knowledge of their chosen occupation. The great object of an apprentice system, viz., providing efficient future mechanics for the trade, is only accomplished in proportion to the success achieved in making the apprentice an earning unit from the start.

Many attempts have been made, particularly by the larger institutions, to accomplish this desired end and the means adopted have varied widely. These in most cases consist of series of lectures usually given by the chief draughtsman or master mechanic during time for which the apprentice is paid. The drawbacks to such systems are many. The lectures interfere more or less with the shop work; they rarely pertain directly to the shop problem occupying the young mechanic's mind at the time, and the lecturer in several cases that have come under our observation, has never been an apprentice himself.

In an association with seven shops employing from ten to thirty apprentices, covering a period of two years, the writer found but one where full and reliable information could be obtained by any apprentice upon such work as he had in hand. In the majority of these plants, the seeker was forced to depend for information upon his senior associates, and upon journeymen whose grace in giving it was often questionable. The logical solution is to appoint an efficient and well paid apprentice instructor of such character as can be emulated with advantage, where the number of apprentices warrants it. If the number be small, this man can well earn his salary by acting as apprentice foreman in addition.

The youth with sufficient ambition to make a desirable mechanic and an earning asset to the firm while training, is always willing to go to night school for his drawing lessons as well as to get his requisite technical knowledge from books if directed in his reading by one whom he can thoroughly respect as having both his and his employer's interests at heart.

VALUE OF A MONTH'S HOLIDAY.

OF late it has been our regretful duty to record the deaths of a number of men filling high and very useful positions in the industrial community. In some cases the end was doubtless brought about more or less directly by overwork and too close and insistent application to very distracting and maybe somewhat thankless tasks. The difficulties experienced in replacing these men have also been called to our attention.

The maintaining of efficient and capable understudies in such a way as to relieve the extremely important men of more or less of the clerical, laborious and disagreeable parts of their work and, at the same time, provide men to supplant them constitutes a vital and vexing problem in connection with the management of all great commercial industrial institutions.

The actual value of a higher official is a quantity that is extremely difficult to estimate as the output or apparent success of the plant is influenced by a great many facts not under his control or chargeable to him. In other words, a great part of his hardest work may be very valuable, but it is still decidedly intangible.

The practice of granting a month's vacation can, by no means, be regarded as a gift to its evident beneficiary, although, if properly taken advantage of by him, it can be made a profitable investment for the firm. This relaxation period should be regarded as a necessary opportunity for testing the fitness of assistants and understudies in a way that is impossible when the official in question is on the job. A close observation of the running of the department or plant during his absence will also furnish the most reliable data as to his real value. It is a most opportune time to plan and develop promotion schemes, for, not only can the worth of the man on vacation be determined, but a suitable man can most easily be spotted to succeed him.

INDUSTRIAL NOTABILITIES--No. 30

THE subject of this biography, Edward Gurney, was born August 4, 1845, at Hamilton, Ont. His father was Edward Gurney, an iron founder, and his mother, Nancy Flarity. Mr. Edward Gurney, the father, was of English descent, and born in New York State, while his mother was of Irish descent, and also a native of New York.

Edward Gurney was educated at the public schools, also at the Hamilton High School. After completing his studies, he engaged with the firm of E. & C. Gurney, learning the trade of moulder, and later entering the firm's employ as clerk. This was in 1863.

In 1868 the Gurney Company bought out the Phoenix Foundry Co. of Toronto, which was carried on as a branch of E. & C. Gurney, with Mr. Edward Gurney as manager. The firm afterward moved to its present quarters on King Street in 1873. In 1893, it was merged into the Gurney Foundry Co., of which Mr. Gurney became president, a position which he still holds.

EDWARD GURNEY.

Mr. Gurney is president of the following Companies: The Gurney Foundry, the Gurney-Massey, of Montreal, and the Gurney Heater Mfg., of Boston. He is also vice-president of the Gurney North-West Foundry Co., of Winnipeg, vice-president of the North American Life Assurance Co., of Canada, and a member of the Toronto, National and Automobile Clubs.

Mr. Gurney married Mary Frances Cromwell of Ingersoll, Ont., daughter of William A. Cromwell, January 2, 1868. They are the parents of the following children: Mary Irene, wife of W. Sandford Evans, Mayor of Winnipeg; Mabel Louise, wife of E. B. Ryckman, of Toronto; William Cromwell Gurney, vice-president of the Gurney Foundry Co.; Edward Holt Gurney, sales manager of the Gurney Foundry Co., and Gladys Gurney, unmarried.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., April 13, 1914.—The Easter holidays interrupted business during the past week, and there is little to report. Machinery dealers still find conditions quiet. Mussen's, Ltd., closed an order of about $1,500 last week for machine tools ordered by the Alberta Government. This firm have also sold a 12½-ton Ruston & Proctor road roller to the Corporation of Knowlton, Que.

The C.P.R. issued a specification for three or four small machine tools for North Bay recently, and a decision in this matter is looked for this week. The same company are also about to place orders for the tools still required for the new steel car shop here, a list of which was recently published in Canadian Machinery.

The Government's tariff alterations have caused little local comment so far. No change in prices due to the new tariff have yet been announced, and it seems unlikely that much advance need be looked for in most lines of steel products. An exception may, however, be made in the case of wire nails, since a duty is to be imposed on wire rods, which have hitherto come in free. Speaking generally, the steel industry ought to materially benefit by the proposed changes. A press despatch received today from Sault Ste. Marie, Ont., credits Mr. J. Frater Taylor, president of the Lake Superior Corporation, with saying that the protection to be afforded to structural shapes of over 35 lbs. per yard will enable the Algoma Steel Corporation to at once go ahead with its plans for the installation of a heavy structural rolling mill of large output. This important step is understood to have been in contemplation for some considerable time.

Good progress is being made with the completion of the Canadian Northern tunnel through Mount Royal. The work of enlarging the preliminary bore is well advanced, and should be entirely finished by the end of May. A commencement has been made with the excavation for the station terminal below Dorchester Street.

The C.P.R. are about to spend a very large sum in four-tracking their line between Windsor Street station and Montreal Junction, a distance of four miles. This will mean the putting down of two additional tracks, and will entail a large amount of filling in, building of viaducts and the widening of two bridges. The total cost is estimated at $1,000,000.

The recent spell of cold weather has greatly retarded the break-up of the ice on the St. Lawrence, and it now looks as if the opening of navigation would be considerably later than usual this year. A few weeks ago wise-acres were giving April 15 as the probable date, but it now appears unlikely that any steamer can enter Montreal harbor before the end of this month. At present writing an almost solid stretch of ice extends nearly down to Three Rivers, and is said to be from one to four feet thick.

Toronto, Ont., April 14, 1914.—No improvement in trade conditions is noticeable this week. The market all round is dull, and seems likely to remain so for some time. It is perhaps rather early to form an opinion as to the effect of the recent reduction in railway rates. The railway companies naturally complain and state that they are being treated unfairly. The situation will no doubt, however, work out for the benefit of the country in general. The reduction in the duty on certain steel products has called forth a variety of opinion, both favorable and otherwise, according to the effect that it will have on the interests concerned. One good feature to be noted is the beneficial effect being produced in the wire rod industry, which had been languishing in recent years. Concerns fabricating structural steel appear to think that an unfavorable effect will be produced on this industry, but the reduction is so slight that it seems hardly probable that they will suffer to any great extent.

An examination of the building permits issued for the first three months of this year shows a slight decrease over the corresponding period of last year for this district, although in some cities an increase is to be noted. The reduction in the price of materials has to some extent offset the effect produced by the financial stringency, although the latter is still holding up large building propositions which require considerable financing. Work on the Toronto harbor improvements will be pushed ahead this year, it being reported that $3,000,000 has been appropriated for this season's work.

No change is to be noted in the steel market. The volume of business is light and prices generally remain stationary, although there is an indication that they may be reduced in the near future, unless an improvement in conditions takes place. Reports from Pittsburg indicate that conditions are becoming quieter and tonnage lighter. An unfavorable feature is the possibility of a reduction of wages in that district. The United States Steel Corporation tonnage of unfilled orders for March showed a shrinkage of 300,000 tons. No new large buildings requiring structural steel are in evidence in Toronto, but some of those now projected may be proceeded with later in the year.

The pig iron market is distinctly dull. The change in prices given last week was on account of the opening of navigation and affected only English and Scotch pig. For other brands prices remain at the same level.

The machine tool market is quiet, with few inquiries, and those only to small specifications. The holiday season appears to have had some effect on this market. Steady business is reported in mill supplies, orders being for immediate requirements only. One local firm of dealers reports having sold a Bignall & Keeler pipe-threading machine.

The general condition of the metal market is dull, with prices inclined to weaken, except copper, which remains

firm. The volume of trade is still light, but merchants are of the opinion that business will steadily improve.

Ottawa, Ont., April 13, 1914.—Between the budget announcements and the western freight rate judgment of the Railway Commission the politicians as well as the business world have been given something to think over during the Easter holidays. The budget announcement has at least had this effect: that it has removed the uncertainty, and nothing is so unsettling to the commercial realm as uncertainty. The budget was a compromise, as most budgets are between the two extremes. The westerners wanted a big slash in agricultural implements. They got some, but not all they wanted. There is a decrease from 17½ to 12½ per cent. on binders, mowers and reapers. Other agricultural implements are untouched.

The steel and iron industry has been making a big lobby for aid. They got substantial assistance, but not all they wanted. The aid takes several forms. The principal changes are an increase in the duty on heavy structural iron to $4.25, $6 and $7 per ton. This will not be put into effect until the Government is satisfied that it can be manufactured in substantial quantities in Canada. That this will give a boom to the manufacture of such lines is undoubted. The total iron and steel and manufactured products imported into Canada last year showed an increase on the year previous of a little under forty million dollars. Of course, this trade is far from being affected.

The Government has also put a duty on wire rods, which were imported last year to the extent of 92,000 tons. The duty has been placed at $2.25, $3 and $3.50. Just how this will affect the small nail manufacturers it is hard to say. They opposed the duty strenuously. At present they buy large quantities of wire rods from Germany and the United States. Now they will be forced to purchase from their own competitors in the nail business, the Dominion Iron and Steel Co., and the Steel Co. of Canada. On the surface at least it looks as if the small manufacturers will be seriously handicapped. The big steel corporations will undoubtedly be able to make nails in their own factories with their own steel products cheaper than firms which must purchase the raw product from them and pay freight to their mills. Mr. White pointed out, however, that if it did work a hardship they had the right to appeal, and the Customs board could again put steel rods on the free list. These are the two main forms of assistance, though Ontario mills must be substantially benefited by the drawback on charcoal and coke used for smelting purposes. To the Nova Scotia corporations having their own coal at hand it makes no difference, but to the Ontario mills buying all coal products in the States this is a concession of importance. How important it is difficult to say. The main other changes are a 10 per cent. duty on brass in sheets and rods. Just how important an item is this is shown by the fact that the imports last year totaled nearly a million dollars. A new firm in West Toronto is at present manufacturing this material. How this will affect manufacturers of machinery remains to be seen. These are the main changes which interest the machinery world.

The western freight rates decision would take an expert to thoroughly analyze, and what is its complete significance will not likely be known until the new rates are put into effect on September 1. One railway authority puts the reductions which have been made at some three million dollars. This is perhaps a little high. Through rates are not affected, although eastern shippers will benefit by the western reductions. The discrimination in rates, which was the original complaint and charge, are permitted and allowed to continue. The board throws aside this charge and deals with the whole question from the standpoint of reasonableness. The result has been a complete readjustment of western rates. Hitherto the standard rate in Manitoba has been 7½ per cent. lower than Saskatchewan and Alberta. Now the three provinces are placed on the same basis. This means a straight reduction for the two other provinces of 7½ per cent. There is also a lowering of distributing tariffs. Winnipeg distributing tariff is lowered by about 7 per cent. and all other western distributing centres are placed on the same basis.

Then, in addition, there are important class reductions. One of the most important reductions, and one which has been rather overlooked in press dispatches, is the reduction on pig iron rates from the head of the lakes to Winnipeg. The rate is now 20 cents per 100 pounds. This is reduced to $3 per gross ton, or a cut of 25 per cent. Winnipeg has already three growing rolling mills. The reduction should give a big impetus to this industry and help to make Winnipeg, with its cheap water power, one of the most important steel and iron centres in Canada. It will likely ultimately help all industries into which iron and steel enter.

Winnipeg, Man., April 11, 1914.—Brokers here understand that the order for machine tools required in the G.T.P. shops, at Prince Rupert, B.C., will be placed in a few days by J. H. Guess, in Montreal. Many local houses have figured on the requirements.

There is considerable demand just now for heating boilers for school buildings, warehouses, etc., which are going up in Winnipeg. Orders for machine tools are coming in fairly well. The Canadian Fairbanks-Morse Co. report this to be the best month they have had since January. They have sent out quite a number of tools during the week, principally to small machine shops and garages. The Regina School Board have placed an order for two metal and wood lathes for use in their technical schools.

The Winnipeg School Board are in the market for a large quantity of machine shop supplies, including tool steel, nuts, washers, bolts, gears, etc., for use in the Kelvin and St. John's Technical Schools. The order altogether will amount to several thousand dollars. A local broker stated this week that Canadian manufacturers of machine tools should have a better chance of securing the technical school business since the duty was enforced on machine tools imported for use in schools.

In the West the budget speech of Hon. Mr. White was received by bridge and iron plant managers with regret. Much of the structural steel used by the large manufacturers is imported from the United States, and the increased duty on large sizes will be particularly felt here. Mayor Deacon, who is president of the Manitoba Bridge and Iron Works, says he will object to the reduction of duty on fabricated iron and steel. The Americans, he says, with low freight rates and cheap labor, will be able to bring their products in here at greatly reduced rates, to the loss of western bridge companies.

Another large western iron and steel manufacturer, speaking on this subject, expressed the belief that the new tariff would injure the United States Steel Corporation, and would be another inducement for them to establish their plant at Windsor. He also stated that British manufacturers would benefit considerably from the changes. One firm that should profit by the changes in the duty on iron pipe is the Page-Hersey Co., who recently erected a large plant at Fort William to supply the trade in Western Canada.

Building permits issued in Winnipeg up to date considerably exceed the three-million-dollar mark, which is in excess of last year. There are many who believe that not 10 per cent. of these buildings will be commenced this year, while there are others who pooh-pooh this idea. They believe that building will be up to standard, but will consist mostly of small structures rather than the large blocks that have gone up in the past few years. The manager of a large western industry, who has just returned from a study of conditions further West, states that the

amount of building out there will exceed that of last year, but will be late in starting. Builders, he says, will be obliged to figure much closer than in former years.

The manager of a large engineering plant in Winnipeg says that he does not intend to spend money this year on new equipment, adding that his business was quieter now than it ever was in 1913. He has kept his plant running all through the winter, employing about 300 men, running ten hours a day, but has accumulated considerable stock. He thought the warmer weather would put new life into business. Speaking of the large number of building permits issued, be observed that this was the best time to build, as both labor and building material were cheaper.

St. John, N.B., April 11, 1914.—According to a cable received from J. Norton Griffiths, M.P., head of the contracting firm having the development work at Courtenay Bay, St. John, in hand, three new dredges are on their way here, besides steam hoppers, to advance that big project, involving an expenditure of more than $12,500,000. The dredges are due to arrive early next week. Seven hundred pieces of machinery were landed here this week by the company, consisting of buckets, dredging equipment, and other apparatus for use in the extensive operations to be pushed forward this year.

F. H. Anson, managing director of the Atlantic Sugar Refinery Co., Montreal, in the city this week, said good progress had been made on the plant, and he expected to have it ready for refining operations this year.

The possibility of another new industry for St. John was considered today at a conference between C. H. Cahan, jun., of Montreal, and Herbert Guernsey, of this city. The proposition is the organization of a company for the manufacture of silicate brick. Mr. Cahan is interested in the Canada Brick Co., and the Silicate Engineering Co., Ltd., of Montreal, both manufacturers of Dominion and Canada bricks. The proposed site for the new industry is at Ketepec.

The machinery has arrived at Gibson, N.B., for the plant of the Concrete Builders, Ltd., who will manufacture marble-faced, pressed blocks, ornamental cornices, pressed bricks, water pipes, tile pipes and concrete blocks. The gravel necessary will be dredged from the Nashwaak River. The company elected officers yesterday as follows:—T. C. Burpee, president; J. J. McCaffrey, secretary and treasurer; H. J. McGrath, manager. The officers, with A. J. Gregory and Hon. J. P. Burchill, constitute the directorate; while others in the company are Albert Kitchen, Ray Burpee, and Hon. H. R. Emerson.

C. A. Wentworth, provincial manager for Foundations, Ltd., who was in the city yesterday, said that the company was making encouraging progress upon its contracts in New Brunswick. The new bridge which they were building across the Miramichi River at Newcastle, is nearing completion, and the five abutments for the steel work are now about finished. This contract involved an outlay of $375,000, and several large coffer dams had to be built. The company's work on the new bridge across the Washademoak Lake for the N. B. Coal and Railway Co. was finished this week.

SOO PRESIDENT LIKES TARIFF CHANGES.

MR. J. FRATER TAYLOR, president of the Lake Superior Corporation, gave out the following statement a few days ago, regarding the increase in the iron and steel duties:

"I have waited for a full report on the tariff changes before expressing an opinion. I am very much pleased that the Government has recognized the serious necessity for assistance to the steel industry in Canada. Speaking generally the changes are in the right direction and will benefit the industry as a whole; but in our specific case, that is, the case of the Algoma Steel Corporation, the promise of definite assistance in the manufacture of the larger sizes of structural steel is a decisive step forward, and will enable the Algoma Steel Corporation to immediately progress with its plans for the installation of a heavy structural mill of large capacity. This has been contemplated for some time, and now that protection is afforded in respect of rolled sections over 35 pounds, there is some incentive to our taking the necessary steps to mature our plans and to arrange our finances. Nothing definite has been done in the matter of encouraging the mining of iron ore, but an investigation is promised, and it is hoped that this will bear fruit."

STEEL CO. OF CANADA REPORT FOR YEAR.

THE pamphlet report of the Steel Co. of Canada for 1913 shows net profits after expending $516,084 for repairs, maintenance, and improvement, of $1,640,011, which compares with net profits of $1,547,039 at the end of 1912, an increase of about $93,000.

Of this amount $480,000 was taken by bond interest, $454,741 by dividends on the preferred stock, $137,500 was credited to the fund for depreciation, renewal and improvement of plants, $56,738 was written off plant account, and $511,681 was carried to credit of profit and loss. The report states that since Dec. 31, the directors have disposed of $850,000 of the first mortgage bonds of the company, and the working capital has been increased by the proceeds of that issue.

The president's report states that during the first half of 1913 the business of the company was active and profitable, but during the last half of the year there was a serious falling off in the volume of business and in prices.

The president says, with reference to the recently announced tariff changes, that "it is thought that these changes will be beneficial to the company."

	1912.	1913.
Brought forward	$ 583,599	$1,060,571
Net profits	1,547,039	1,640,000
	$2,130,638	$2,700,581
Less—		
Bond interest	465,327	480,000
Pref. dividends	454,741	454,741
Depreciation	150,000	137,500
Written off	.....	56,738
Balance	$1,060,571	$1,571,602

The general balance sheet shows that current liabilities, consisting of accounts and bills payable and dividend due February 1 have been reduced from $4,018,926 at the end of 1912 to $3,069,449 at the end of 1913, a decrease of $949,477; but, on the other hand, a new item of $1,200,000, convertible promissory notes, due July 1, 1915, 16 and 17, appears in the liabilities.

Current assets, consisting of material, cash on hand, etc., show a decrease of $305,823, the figures being, 1912, $8,007,889; 1913, $7,702,066.

The annual meeting is called for Monday, April 27.

STEEL CORPORATION OUTPUT.

THE production of the Dominion Steel Corporation for the fiscal year ending March 31, shows some curious changes. There is a very large falling off in the production of wire rods and an increase in wire products. Shipments were less. The statement compares with the previous year as follows:

	1914.	1913.	Increase or Decrease.
	Tons.	Tons.	Tons.
Coal	5,026,645	5,053,160	— 26,515
Ore received	810,821	704,542	+106,279
Pig iron	334,101	321,020	+ 13,081
Steel ingots	331,349	343,251	— 11,902
Rails	176,505	174,802	+ 1,703
Wire rods	30,778	53,323	— 22,545
Bars	16,736	451	+ 16,285

Shipments	246,250	287,591	— 41,341

A "Safety First" campaign is being inaugurated by Superintendent Gaboury, of the Montreal Tramways Co. Letters containing suggestions have been mailed to all employees, chauffeurs and hack drivers throughout the city.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Wiarton, Ont.—The Peninsular Tug & Towing Co. has opened a machine shop here.

Redcliff, Alta.—It is reported that the Ornamental Iron Works Co. will enlarge their plant.

Peterborough, Ont.—The board of works will probably purchase a boiler for use in thawing drains and hydrants.

Welland, Ont.—The Supreme Heating Co., stove manufacturers, are increasing their capital and will make an addition to the plant.

Ingersoll, Ont.— Operations will be commenced at the Wilson & Short factory at an early date. Most of the machinery has been installed.

Winnipeg, Man.— An automobile assembling plant, employing about 500 people, will probably be built in Winnipeg or just outside the city by the Ford Motor Co., of Detroit, Mich., very shortly.

Kelowna, B.C. — Messrs. DuCane & Dutcher, engineers of Vancouver, have reported in favor of an extension to the existing municipal power plant, and the addition of a boiler, steam engine and auxiliaries.

Sarnia, Ont. — The new Perfection Stove Co. plant in the south end of the town will soon be ready for operation. Carpenters are at work laying the floors in the main building, and the machinery will be installed very shortly.

Wallaceburg, Ont.—The Wallaceburg Electric Light Co. has at last accepted the city's offer of $30,000 for the plant, after holding out for some time in the hope of getting an additional $5,000. A by-law will be prepared shortly to let the people decide the matter.

Fort Erie, Ont. — The International Register Co., has been incorporated with a capital of $100,000. The company will build a factory here for making small safes, registers, etc. Mr. S. A. Waugh is president of the company.

Saskatoon, Sask.—The premises of the John East Foundry Co., were partly destroyed by fire on April 10. The fire was confined largely to the pattern shop where the most damage was done, the loss being estimated at between $7,000 and $8,000 covered by insurance. Rebuilding will be commenced at once.

Regina, Sask.—Wilson & Wilson have been awarded the contract for the completion of the new power house, the contract price being $90,800, and it is understood that work will be commenced at once. The steel work is already up and the new contract will cover the brick work, concrete roof, interior finishings, etc. An effort will be made to complete all work before the Fall.

Nanaimo, B.C.—The Dominion Shale & Brick Co., whose works are situated on Gabriola Island, are getting ready to cope with the coming season's business, which is already showing increasing signs of activity. They are at present busy installing their own electric light plant. A "Klose" kiln is also being installed.

Collingwood, Ont. — The scrutiny of the ballots in connection with the recent voting on the Imperial Steel and Wire Works by-law has been completed, and while the written judgment will not be handed down for a few days, it is understood that the by-law received the 36 votes over the two-thirds requirements, or 888 to 629. The by-law guarantees the bonds of the company to the extent of $100,000.

Galt, Ont.—Engineers from the Dominion Public Works Department in Freeport have been making surveys and taking levels in connection with the proposed erection of several large dams across the Grand River for conservation and regulation of the water, with the object of abating spring freshet damages and securing a more regular flow in summer months. It is not unlikely that a large dam will be built at Freeport.

Electrical

Swift Current, Sask. — The city will purchase a site for a light and power plant.

Embro, Ont.—A public meeting of the ratepayers has been called for Thursday evening, April 16, to discuss the hydro electric proposals. It is expected that estimates will be secured shortly.

Woodbridge, Ont.—By a large majority on Saturday the ratepayers decided at the polls to enlist under the Hydro banner and enjoy the advantages of cheap power. The by-law was carried by a vote of 96 to 4.

Brantford, Ont.—At a recent meeting of the water commissioners it was decided to ask for tenders for the new electric pumps and the new extension to the pump house.

Nelson, B.C.—To reduce operating expenses at the gas plant the city council on the advice of the superintendent has decided to order an electric motor exhauster to replace the steam exhauster at present in use.

Sidney, N.S.—It is stated that the Dominion Steel Corporation will shortly begin to operate their wire rod mills on full time. For the last three years they have not been working more than three days a week.

Halifax, N.S.—The Provincial Government have appointed a special committee to inquire into the necessity of periodical boiler inspection in all factories and plants. It is generally believed that a bill be drafted and introduced in the Legislature.

St. Catharines, Ont.—At a meeting of the Niagara district Hydro Radial Union held recently, it was decided to ask the various municipalities in Lincoln, Welland, Haldimand and East Wentworth to petition the Hydro Commission to make a survey for a proposed radial line through the peninsula.

St. George, Ont. — One hundred and twelve residents of South Dumfries have petitioned for hydro-electric service. This list includes only a few in St. George, the majority being farmers representing every section in the township east of the river. The petition has been forwarded to the commission and their engineer will investigate and report.

Wingham, Ont.—The Culross township council have passed a motion that this municipality join with other municipalities in the district in membership in the North-Western Ontario Hydro Association for the purpose of laying before the Ontario Hydro Commission their position with the object of urging their right to share in the advantages bestowed on other places, on terms that will equalize the disadvantages that they are at present placed under.

Hamilton, Ont.—The decision of the Government in lowering the duty on bituminous coal entering Canada will re-

sult in the building in this city of a $2,000,000 coke and gas plant by the United Gas & Fuel Company. This work will be commenced at once and will give employment to several hundred men. In addition to assuring a supply of millions of tons of coke every year, the new plant will supply coke gas at a low figure in various parts of the city.

Edmonton, Alta.—The following tenders were received for steam turbines, alternator and condensing plant, for the Edmonton power-house, and have been referred to the power-house superintendent for report: Allis-Chalmers Mfg. Co., (a) $103,815; (b) $106,350; James Howden & Co., Glasgow, $81,963; Willans & Robinson, Ltd., Rugby, Eng., $90,370; Escher Wyss & Co., $79,000; $78,400; $86,000; Laurie & Lamb, $96,750; $92,725; $93,475; Fraser & Chalmers, $87,100; $94,100; $87,300; Westinghouse Machine Co., $94,500; $112,875.

Municipal

Brandon, Man.—The city council are considering the question of installing an incinerator.

Aylmer, Ont.—The town council are considering the purchase of an incinerator.

Berlin, Ont.—A motor truck will replace the horses at No. 1 Fire Station, according to the decision of the city council on April 5.

Stratford, Ont.—Readings have been given to the following by-laws: Installing an incinerator, and an improved street lighting system.

Hamilton, Ont.—City Engineer Macallum will recommend enlarging the Trolley street sewage disposal plant, instead of building another near the jockey club as planned.

Victoria, B.C.—Additions to the city's water works distribution system will require 10,000 feet of 4-inch steel pipe. Bids will immediately be called for this material.

Toronto, Ont.—It is proposed to build a modern sewage disposal plant and drainage system for North Toronto, at an estimated total cost of about $4,145,000.

Wiarton, Ont.—A by-law will be voted on by the ratepayers on April 16, to authorize the granting of concessions to the Canada Casket Co., who propose to build a factory here.

Toronto, Ont. — A new centrifugal steam pump, capable of pumping 16,000,000 gallons of water in 24 hours will be installed in the main pumping station this month. The concrete intake pipe to connect with the pump has been completed.

Esquimalt, B.C.—At a special meeting of the town council held recently tenders for the supply of sewer piping necessary for the district's new sewerage system were opened. No action, however, was taken, the communications being referred to C. H. Topp, the engineer, for report.

Vancouver, B.C.—By-laws for civic capital expenditures for waterworks and probably other matters will likely be submitted to the electors in the course of a few months, the necessity for further money being evident from the discussion at the waterworks committee meeting held recently.

New Westminster, B.C.—City Engineer Blackman and a staff of men have commenced work making soundings on the site adjoining the present reservoir on Eighth avenue, Sapperton, where it is proposed to locate the large new reservoir, which will have a capacity of four million gallons.

Moose Jaw, Sask.—A by-law was introduced and read a second time at a city council meeting held on April 1, to raise the sum of $50,000 for the building of the exhibition grounds, race track, grand stand, stabling, and the making of the necessary improvements on the ground belonging to the city for that purpose.

London, Ont.—City Engineer W. N. Ashplant is calling tenders for storm sewers that represent an approximate expenditure of $125,000. The sections to be done first are: Egerton, Colborne, Adelaide and Ridout Streets, and Wharncliffe Road, an aggregate of 9.14 miles of mains and 2.66 miles of connections to gulleys.

Port Coquitlam, B.C.—By the unanimous adoption of recommendations placed before the council recently by the fire committee, this city will spend in the neighborhood of $10,000 for the purchase of fire equipment. Fire alarm signals and telephone call boxes will be a part of the scheme and it is also intended to purchase an auto combination ladder and hose truck at an approximate cost of $6,500.

Saskatoon, Sask.—Seventeen money by-laws, representing $475,000 capital expenditure of the city, will be submitted to the people for approval at an early date. The by-laws will include:—Power house over expenditures, $15,000; pumping plant extensions, $10,000; electric light and power plant extension, $200,000; extensions to street railway, $25,000; water meters, $25,000; electric light and power plant service extensions, $85,000.

Victoria, B.C.—The city council has opened the tenders called for riveted steel pipe for the water conduit in connection with the Sooke Lake water system. One specification called for 5/16-inch steel pipe and the other for 3/8-inch. The tenders received were as follows:—From the Burrard Engineering Co. of Vancouver, (1) $112,750, (2) $211,250; from Hutchison Bros., (1) $120,950, (2) $221,390; from Fred V. Robertson, (1) $129,150, (2) $236,600; from Victoria Machinery Depot, (1) $132,225, (2) $251,810; from Moore & Pethick, (1) $141,860, (2) $238,628; from the Canada North-West Steel Co., (1) $148,625, (2) $274,625. No award will be made until a report has been furnished by the city engineer.

General Industrial

Berlin, Ont.— A building permit has been issued to Harry Tolton, who proposes to erect a shirt factory.

Calgary, Alta.—A firm in the States have written to the Board of Trade expressing their desire to appoint an agent to handle their asbestos products.

Nelson, B.C.—It is announced that a small plant will be built here to demonstrate the existence of platinum in this district.

Nelson, B.C.—The first shipments will be made this summer from the marble quarry owned by George Carruthers, of Winnipeg.

Stratford, Ont.—The city council have taken over the Kemp factory and are looking for a suitable concern to take possession.

Toronto, Ont.—Fire destroyed part of the tannery of H. B. Johnston & Co., River street. The loss is estimated at $10,000.

Vegreville, Alta.—The Alberta Farmers' Co-operative Elevator Co., will probably build a 60,000-bushel elevator here. P. S. Austin is a director.

London, Ont.—The Ford Motor Co. have purchased a site on which they will erect a brick building to be used as a distributing and service station.

Edmonton, Alta. — J. H. Lavalee, of this city, will build a paint factory. The contract for the construction of the building has been let to A. H. Harrer.

Tillsonburg, Ont.—It is planned to improve the town's fire fighting apparatus. A new and modern alarm system and a pump, with electric fixtures for rapid action, will be installed.

St. John, N.B.—The plant being erected by the Atlantic Sugar Refineries will be finished early this summer. The buildings are nearly completed and the machinery is being installed.

St. Thomas, Ont. — The Stacey Mfg., Co., Cincinnati, have offered to build another lift to the gas holder at the municipal gas plant. This will double the capacity, making the total 204,000 cub. feet.

Swift Current, Sask.—I. A. Welk and J. J. Nickel will build a flour mill with a capacity of 1,000 barrels a day. A unit having a capacity of 400 barrels will be built first and be in operation this fall.

Sarnia, Ont.—It is rumored that the Solvay Co. of Detroit is considering the location of a branch plant here. It is said the company is negotiating for land on the old Indian reserve, below the town.

Hamilton, Ont.—The new Buff Brick Co., which is situated near Rymal, will be able to start operations in the course of a couple of months. The firm expects to turn out 30,000 brick each day. Already they have received a number of orders.

Chatham, Ont.—Starting from an explosion, the cause of which is unknown, fire on April 10 completely destroyed the plant of the Canadian Wolverine Brass Co. on St. Clair street, causing a loss that is estimated at from $25,000 to $30,000.

Fredericton, N.S.—The lands of the Gibson Lumber Co. have been acquired by the Partington Pulp & Paper Co. The new property includes a large area of the best lumber lands in the Province of New Brunswick, situated along the Nashwaak River.

Sarnia, Ont.—A prominent manufacturing firm in the United States is looking for a good location at Point Edward, on which it intends to build a good-sized plant for the manufacture of a creosote preparation for use on block pavements and railway ties.

Belleville, Ont.—Fire did considerable damage to a cooperage owned by R. J. Graham of this city on April 7. The blaze started in the furnace room in the basement, which has not been used for some months, and worked up to the roof. The loss will be from $800 to $1,200.

Belleville, Ont.—Fire on April 7 destroyed a cheese-box factory in this city operated by Mr. S. T. Vandervoort. Some 500 boxes were burned, in addition to a large quantity of lumber. The loss to Mr. Vandervoort was about $1,500, which is partially covered by insurance.

Toronto, Ont.—The Public Roads and Highway Commission have submitted their report to the Legislature. The report recommends the expenditure of thirty million dollars on good roads throughout the province. The cost is to be shared by the province, counties and cities.

Berlin, Ont.—Oscar Rumpel, who has been superintendent of the Berlin Felt Boot Co. owned by the Canadian Consolidated Felt Co., has resigned his position to start an independent felt boot industry. He has leased the old William Greene and Rome building, and operations will commence in the near future.

Wallaceburg, Ont.—North branch farmers, acting in conjunction with the executive committee of Wallaceburg board of trade, have contributed $8,500, and the Dominion Sugar Co. has signified its intention to give $10,000, providing the town and Provincial Government add a similar grant toward the good roads work.

London, Ont.—Fire broke out in the factory occupied by the Rice Cigar Box Mfg. Co., on Ridout street, shortly before midnight on April 13, completely gutted the building and destroyed the plant and stock. The loss is about $26,000, of which only part is covered by insurance. The origin of the fire is not known.

Duncan, B.C.—A new and important industry is being established here by the Interior Hardwood Finishing Co., of which the general manager and president is O. J. Martin. The company has purchased seven acres of land and proposes to erect dwellings for its employees close to the factory where will be manufactured polishes, stains, etc.

Strathroy, Ont.—A factory consisting of two buildings will be erected to replace the plant of the Canadian Handle Co., which was destroyed by fire. The contract for their erection has been awarded to John J. Smith and work will start at once. The main building will be 180 x 40 feet and adjoining it will be a sawmill two storeys in height, 72 x 36 feet. The latest machinery is to be installed.

Iroquois Falls, Ont.—Excavations for the foundation of the paper mill, the largest of the several buildings composing the Abitibi Pulp & Paper Co. plant, will commence within the next few days. The mill will be ready for occupancy on June 1, but the construction of this building will not interfere with the starting of the machinery some time in May. Present plans are that wheels will turn at the pulp mill then. The paper mill will be 500 feet in length and nearly 300 feet in width.

Building Notes

London, Ont.—Building permits will be issued shortly for a $19,800 addition to the plant of Silverwoods, Ltd.

Calgary, Alta.—Plans for the erection of a 6-storey warehouse, for the Gutta Percha & Rubber, Ltd., are being prepared, estimated cost $50,000.

Medicine Hat, Alta.—It is announced that the Maple Leaf Milling Co., and the Ontario and Manitoba Milling Co., will start building operations in May. Each mill will have a capacity of 2,000 barrels.

New Incorporations

The Luxfer Prism Co., Ltd., incorporated at Toronto, capital $9,000, to manufacture luxfer prisms, etc., at Toronto. Incorporators: William Cowan, Harry B. Nicol, etc., Toronto.

William Markus, Ltd., incorporated at Toronto, capital $40,000, to carry on the business of contractors at Pembroke. Incorporators: William Markus, Joseph H. Bruck, etc., Pembroke, Ont.

Taxis and Motors, Ltd. has been incorporated at Ottawa with a capital of $200,000 to carry on business as manufacturers of automobiles in Montreal, Que. Incorporators: J. A. Ducharme, E. Halley.

Canadian Niagara Linens, Ltd., incorporated at Toronto, capital $300,000, to manufacture linen and cotton goods, etc., at Niagara Falls, Ont. Incorporators: Elena Duggan, William A. Bew, etc., Toronto.

Rotary Amalgamators, Ltd., incorporated at Toronto, capital $40,000, to manufacture and deal in mining machinery, at Toronto. Incorporators: Mervil Macdonald, Geoffrey Adams, etc., Toronto.

The Canadian Burrell Co., Ltd., has been incorporated at Toronto with a capital of $40,000 to carry on a general engineering and construction business at Windsor, Ont. Incorporators: J. C. Burrell, G. S. Middleton.

Cairnie & St. George Ltd., has been incorporated at Ottawa with a capital of $200,000 to carry on a business as engineers and contractors in Montreal, Que. Incorporators, L. McD. Cairnie and H. L. St. George.

The Ottawa Motor Transport, Ltd., incorporated at Toronto, capital $40,000, to carry on the business of cartage contractors, etc., at Ottawa, Ont. Incorporators: George D. Kelley, Charles H. Maclaren, etc., Ottawa.

Kel-Kee Cycle Car Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture, buy and deal in all kinds of power-propelled vehicles at Toronto. Incorporators: James J. Maclennan, John N. Black, etc., Toronto.

The Port Stanley Mfg. Co., incorporated at Toronto, capital $40,000, to acquire the business carried on at Port Stanley by Lawrence W. Lee and Andrew C. Wiley, at Port Stanley, Ont. Incorporators: Nathan S. Cornell, Harley Taylor, etc., Port Stanley.

Tenders

Victoria, B.C.—Sealed tenders will be received by the undersigned up to Monday, May 4, 1914, for the supply of 10,000 feet of 4-inch steel pipe for water works purposes. W. Galt, city purchasing agent.

Winnipeg, Man.—Tenders will be received up till April 30 for the manufacture, delivery and erection of two 3-phase synchronous condensers. Plans and specifications may be obtained from the City Light and Power Department, Winnipeg, Man.

Ottawa, Ont. — Tenders addressed to the undersigned, at Ottawa, will be received up to noon of May 4, for the construction of a steel single screw hopper barge, to be delivered at Sorel. Full information and specifications in connection with the above can be procured on application from the purchasing and contract agent, Department of Marine and Fisheries, Ottawa.

Toronto, Ont. — Sealed tenders addressed to the undersigned will be received at this office until 4.00 p.m., on Monday, April 20, 1914, for the supply of electric material, including transformers, switchboards, nameboards, conduit, etc., as per plan, list and specification. These and forms of contract can be seen and forms of tender obtained on application to R. C. Desrochers, Department of Public Works, Ottawa.

Ottawa, Ont.—Sealed tenders addressed to the undersigned will be received until Monday, April 27, 1914, for the supply of "brooms and brushes," "chain," "hardware," "hose," "oils and greases," "packing," "paint, paint oils, etc."; "manila rope," "wire rope," and "steam pipe, valves and fittings," for the departmental dredging plant in Ontario and Quebec. Combined specification and form of tender can be obtained at the office of A. E. Dubuc, Esq., District Engineer, Montreal, Quebec; J. E. Sing, Esq., District Engineer, Toronto, Ont., or as under. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Toronto, Ont.—Tenders will be received up to noon Tuesday, April 28, for the supply and installation of cold storage equipment in the Toronto Municipal Abattoir, situated on Tecumseh street. Tenders will be received in bulk for the ice machine equipment complete, including piping, cork insulation, floors of freezing rooms, cold-storage doors and windows, electric wiring, plastering, painting, tracking, conveyor, motors, scales, racks for freezers, etc. Specifications, tender form and all information desired may be obtained upon application at the office of William R. Perrin, 530 King street east, Toronto, Ont., or 200 Old Colony Building, Chicago, Ill.

Wood Working

Toronto, Ont.—The Canada Furniture Manufacturers, Ltd., have asked the private bills committee for power to sell their plant and properties to pay off liabilities and to transfer some of the stock of the old company into a new company to be organized.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Personal

E. S. Fraser, C.E., has been appointed town engineer of New Glasgow, N.S.

H. Cameron, who has just arrived in this country from Glasgow, has taken up his duties as assistant manager of Canadian Vickers, Ltd., Maisonneuve, P.Q.

W. H. Childs has been appointed assistant manager to the Hydro-Electric Commission, Hamilton, Ont., at a salary of $1,500 per year.

J. W. Battershill, at present on the staff of the city engineer, Winnipeg, has been appointed engineer to the municipality of East Kildonan, Man.

Carr L. Glasgow, until recently district manager of Allis-Chalmers-Bullock, Ltd., Montreal, has entered the service of Fairbanks, Morse & Co., New York.

E. T. Sifton, who has been consulting engineer for some time to the Hydro-Electric Commission, Hamilton, has been appointed general manager at a salary of $4,500.

Graham Drinkwater, vice-president of the Canadian Fairbanks-Morse Co., who has been confined to his home with pneumonia since last week is reported to be making satisfactory progress towards recovery.

Manitoba University. — Dr. H. R. Armes, lecturer in chemistry, has been promoted to the rank of assistant professor and J. W. Dorsey, lecturer in electrical and mechanical engineering, is now assistant professor.

Frank Neal, who has been general superintendent of the Eastern Car Co., has severed his connection with the plant, and leaves shortly for Pittsburg. Previous to going to New Glasgow Mr. Neal was superintendent in the Halifax car shops.

William Newman, works manager of the Polson Ironworks, Ltd., Toronto, has been appointed, by the Vessel Fire Register, New York, chief inspector for the Canadian department of this company. Mr. Newman's duties will consist of appointing local inspectors in the different ports and issuing certificates of classification on their various reports. All boats carrying certificates are granted a reduction in fire insurance rates by the various insurance companies.

Arthur L. Mudge and A. Leo Mieville have become associated with Kerry & Chace, Limited, consulting engineers, Toronto, as managers of the electrical and mechanical branches, respectively. Mr. Mudge was for over four years chief electrical engineer in the Toronto office of Smith, Kerry & Chace, while Mr. Miéville was until recently engineer in Canada for W. H. Allen, Son & Co., Bedford, England.

Henry Beatty, for many years a proprietor of steamers on the Upper Lakes and formerly manager of the Canadian Pacific Lakes Service, died last Friday at his residence, 207 Simcoe street, Toronto, after an illness of two days. He had been in failing health for some months, but was able to be at his office as recently as Wednesday. Mr. Beatty was born at Cootehill, County Cavan, Ireland, eighty years ago, and came to Canada when he was nine years of age.

WHO'S WHO.

C. ANTONY ABLETT,
Manager, Siemens Co. of Canada, Ltd., Montreal.

The Regina Engineering Society held a very successful and enjoyable informal smoker on April 9, in the Civil Service Association rooms at the Parliament Buildings. City Commissioner L. A. Thornton occupied the chair, and during the evening the following programme was rendered: Pianoforte solo, M. L. Allen; song, Mr. Herbert Davies; step dance, Mr. Fred Gage; mandolin solo, Mr. H. S. Shope; song, Mr. J. B. Edie; elocution, Mr. R. E. Davies; song, Mr. W. Laird; selection, Mr. F. R. Hoole; flute solo, Mr. G. Watts; step dance, Mr. W. McGregor; raconteur, Mr. W. R. Harris; song, Mr. Wynne Roberts; accompanist, Mr. A. J. Leigh.

Trade Gossip

Rock & Power, Ltd., Royal Bank Building, Toronto, have been appointed exclusive agents for Canada for the Union Boiler Works, Erie., Pa., and the Erie Engine Works, Erie, Pa.

W. H. Banfield & Sons, Toronto, are filling the order received by the International Mail Equipment Co. of Canada, Toronto, for 100,000 rural mail boxes from the Dominion Government.

The Hare Engineering Co., Ltd., Toronto, are installing two 80-h.p. Fulton water cooled mechanical stokers in the plant of the Berlin Light Commissioners, Berlin, Ont.

The Hare Engineering Co., Ltd., Toronto, have secured the order for nine 316 horse-power Fulton water cooled mechanical stokers for installation in the New Glasgow plant of the Nova Scotia Steel & Coal Co.

Chapman & Walker, Ltd., Toronto, have secured the exclusive agency for the General Electric Co. of England, in Canada. This includes all products of the General Electric Co., and allied concerns with the following lines: A. C. & D. C. motors; A. C. & D. C. generators; turbo generators; lamps and steam turbines. The General Electric Co. have branches in nearly all countries of the globe, and the company have a capitalization of $7,500,000.

Winnipeg Shipbuilding.—With the building of a steel steamboat for trading by the Hudson's Bay company in the far north, Winnipeg has given birth to a new industry. The builders are the Doty Engine Works. Constructed specially for the navigation of the shallow rivers in the north, the boat is 150 feet long with a 28-foot beam. The new steamer has been put together at the works of the builders in Winnipeg and will be taken down and shipped to Fort McMurray, where the different sections will be re-assembled. The engines will be installed at the northern post.

THE CAMEL HAIR BELTING

As a Power Transmitter is Cheapest—Why?

BECAUSE! It lasts longer than any other belt on the market.
BECAUSE! It slips just one-half that of any other belting.
BECAUSE! It will run equally well in damp, wet or a dry atmosphere.
BECAUSE! It is less affected by acid fumes and high temperatures than any other Belting.
BECAUSE! It is uniform in thickness and runs true.
BECAUSE! Of its great strength—almost twice that of best oak-tanned double leather.
BECAUSE! It requires much less attention than other styles of belting.
BECAUSE! The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
BECAUSE! It transmits more power than any other belting.

Refrigeration

Lethbridge, Alta.—The Southern Alberta Cold Storage Co., Ltd., will build a cold storage plant at an estimated cost of $60,000.

Fort Francis, Ont.—The Fort Francis Hotel has been equipped with a 4-ton refrigerating plant, furnished by the York Mfg. Co., York, Pa.

Ottawa, Ont.—At the final meeting of the Ottawa Hockey Club held on April 1 it was announced that the club would probably have an artificial rink for next season.

Brantford, Ont.—Local business men have organized a company with $50,000 capital, to establish a 40-ton ice-making plant in Brantford. Plans are being completed.

Calgary, Alta.—The new hotel erected for the Canadian Pacific Ry., has been equipped with two 20-ton refrigerating machines, furnished and installed by the Linde-Canadian Refrigeration Co., Montreal.

Walkerville, Ont. — The Walkerville Brewing Co. will install a 70-ton electrically driven refrigerating machine, contract for which was let to the Huetteman & Cramer Co., Detroit, Mich.

Lethbridge, Alta. —The Southern Alberta Cold Storage Co., it is announced, will build a cold storage warehouse during the spring and summer; plant to cost about $75,000.

Maxville, Ont.—The Maxville Creamery Co. are installing a 7-ton refrigerating plant, contract for which was let to the Creamery Package Mfg. Co., Chicago, Ill.

Berwick, N.S. — The United Fruit Companies contemplate building a cold storage warehouse and fruit precooling plant at Berwick. A subsidy from the Dominion Government has been applied for.

Porpoise Harbor, B.C. — The British Columbia Fisheries Co. have purchased a site at Porpoise Harbor, opposite Port Edward, where, it is stated, they will erect a new ice-making and fish-freezing plant.

Hamilton, Ont.—The Dominion Power & Cold Storage Co. has had plans prepared by Prack & Perrine, architects, for a cold storage warehouse to be erected soon at a cost, it is stated of about $150,000.

Edmonton, Alta.—The Swift Canadian Company will enlarge their plant. The plans call for a three-storey brick and reinforced concrete building, 64 x 80, part of which will be equipped for cold storage purposes.

Toronto, Ont. — A new artificial ice plant will be erected in the city by the Crystal Ice Makers, Ltd. The plant will have a capacity of one hundred tons a day. The contracts have been let and operation is expected by June 15 next.

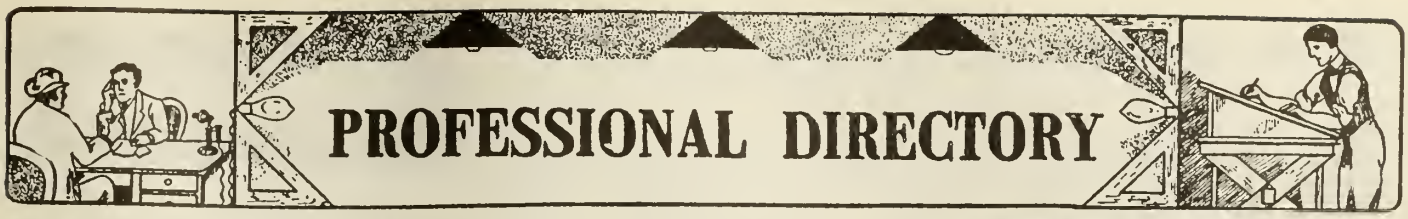
Winnipeg, Man.—The Manitoba Cold Storage Company will build a large addition to their plant. The contract for the building has been let to J. McDiarmid & Co., and the Vilter Mfg. Co. will supply a 320-ton ammonia compressor. S. H. MacColl is managing director.

Montreal, Que.—The directors of the Montreal Arena have definitely decided to install an artificial ice plant for skating purposes. Work on the plans is being commenced forthwith, and when these are completed tenders will be invited. It is desired to have the rink ready for operation early next fall.

Catalogues

J—M Pipe and Boiler Insulation, catalogue No. 100, deals with the asbestos and magnesia products of the Canadian H. W. Johns-Manville Co., Toronto. A complete line of pipe covering and boiler insulation is illustrated and described. Tables are included giving thickness, weights and prices of sectional pipe coverings, while prices for other products are also given. The catalogue has an attractive cover and a complete index.

The C. C. Self-Cleaning Strainer is described fully in a booklet entitled "Protecting the Hearts of Industries," published by the Crane Valve Company, Bridgeport, Conn. The advantages claimed for this strainer are set forth and a sectional view shows clearly the method of application. A table is included giving the prices for the various sizes and another table accompanied by diagrams gives the principal dimensions for each size.



Electric Fans are dealt with in a booklet No. 724, recently published by Veritys Ltd., London, England. The "Aston" line of ceiling and desk fans are fully illustrated and described with shipping particulars given in each case. Illustrations and particulars are also given of the "Aston" fan speed regulators, while two pages are devoted to a description of the "Aston Sirocco" pressure blowers, accompanied by tables giving the principal dimensions of each size.

The Cleveland Twist Drill Co., Cleveland, O., have distributed the April number of "Drill Chips," their recently inaugurated house organ. The booklet is of novel and attractive design, the 16 pages being arranged so as to gradually increase in width from front to back with an illustration of a drill at the side of each page. The reading matter is humorous, but at the same time of a philosophical nature, making the booklet interesting while advertising the product in an effective manner. The illustrations apart from those of the drills, are of a humorous nature.

The Grinnell Automatic Sprinkler bulletin for April has come to hand. This bulletin, which is published quarterly by the General Fire Extinguisher Co., New York and Providence, contains photographs of prominent buildings, showing the damage done by fires, with a brief commentary on each. Reference is made to an equipment of "Grinnell" automatic sprinklers on the S.S. "Imperator" and "Vaterland," accompanied by illustrations. A record of fires in buildings equipped with the "Grinnell" sprinkler is given with the loss in each case recorded.

Sleeper & Hartley, Worcester, Mass., have sent us several bulletins, each dealing with a particular line of machinery which they manufacture. The bulletins are numbered as follows: 252, 254, 260, 261, 264, 267, 268, 270, 272 and 275. The bulletins describe such products as wire straightening, flattening and bundling machines, torsion spring and spring setting machines, universal and plain coiling machines, automatic tube straightening machines and helical cutting and hooking machines. Each bulletin is illustrated and contains a comprehensive description of the machine to which it is devoted. Copies of the bulletins may be obtained from the Canadian branch at Coaticook, Que.

Mechanical Power Transmission Machinery is the title of a very complete catalogue issued by Canadian Allis-Chalmers Ltd., Toronto. That power transmission covers a wide field and calls for many and varied types of equipment is amply demonstrated in this catalogue. Illustrations and descriptive matter of practically everything relating to transmission machinery, too numerous to mention in detail, are contained in this catalogue. The tables of dimensions and other data accompanying each item are sufficiently complete for the use of purchasing agents and others. The catalogue contains a number of mechanical tables and similar data, all useful for transmission calculations. The illustrations are very clear and the reading matter well arranged and comprehensive. The catalogue contains a complete index and is well bound in attractive cloth covers.

Book Reviews

Coal Mine Fatalities in the United States is the subject of a bulletin recently issued by the Bureau of Mines, Department of the Interior, Washington, D.C. The bulletin contains a statement for the month of December, 1913, compiled by Albert H. Foy, giving the number of fatal accidents in coal mines during that month. A number of tables are included, giving the number of casualties for each month during 1913, and in each State, also the cause of the fatalities.

Industrial Research in America is the title of a bulletin published by Arthur D. Little Inc., chemists and engineers, of Boston, Mass. The contents of the bulletin consist of a presidential address read before the American Chemical Society at Rochester, N.Y., on Sept. 9, 1913, by Mr. Little, and reprinted from the Journal of Industrial and Engineering Chemistry. The paper contains a great deal of interesting information on research work carried out in connection with a varied number of industries in the United States.

THE PROPRIETOR OF LETTERS PATENTS No. 136,289, C. A. W. Hultman, relating to "Apparatus for producing cable blocks of cement or the like provided with several channels," and No. 140,104 relating to "Conduits for cables and method for producing such conduits" desires to dispose of the patents or to grant licenses to interested parties at reasonable terms with a view to the adequate working of the patents in Canada.

Our No. 18 BUFFER

is a necessity to every machine shop. Constructed from the very best metals and thoroughly up-to-date in every respect.

It is **absolutely guaranteed** to meet with the users' complete approval. This is a **Buffer** that has "**made good**" with other firms. **Why hesitate about giving it a trial?**

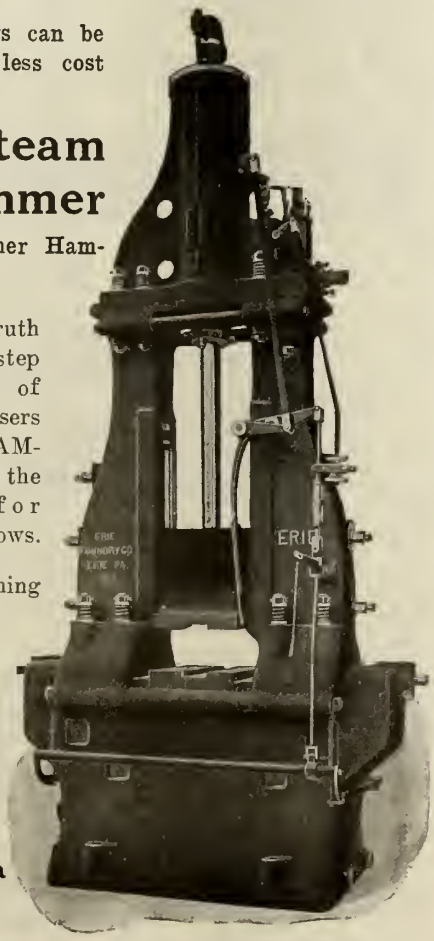
Full details and prices on request.

Valley City Machine Works

20 Compau Street, GRAND RAPIDS, MICH.

Selling Agents in Canada: Williams & Wilson, MONTREAL. General Supply Co. of Canada, OTTAWA and TORONTO.

More drop forgings can be produced and at less cost with an



"Erie" Steam Drop Hammer

than with any other Hammer on the market.

If you doubt the truth of that statement, step into the factories of some of the large users of "ERIE" HAMMERS and ask the man responsible for production. He knows.

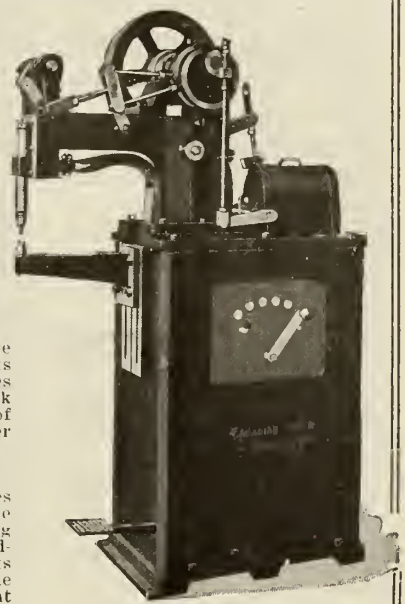
We build Trimming Presses also.

Send for bulletins.

Erie Foundry Company

Erie, Pennsylvania

Agnew



Spot and Butt Welding MACHINES

Do the Work Rapidly and Economically

We are the pioneer builders of Electric Welders in Canada. If you do any quantity of welding or riveting you should investigate, at once, the merit of AGNEW Electric Welders. Let us study your welding problems and advance our ideas regarding your particular work.

Our machines are of the highest electrical efficiency, and we find by actual meter tests that they will in all cases do a given amount of work with less consumption of current than any other machine on the market.

We have good facilities for demonstrating these claims and the intending purchaser of electric-welding apparatus who expects to use a considerable amount of electric current should investigate this feature.

No. 21-D Spot Welder

will spot-weld from No. 30 to No. 10 sheet metal.
Depth of throat, 14 inches.
Adjustment of lower horn, 7 inches.
Water-cooled reversible points.
Height of dies from floor, 40 inches.
Floor space, 18 x 32 inches.
Transformer capacity, 15 K.W.
Operated either by foot-lever or belt power, leaving operator free to use both hands.
Speed 100 to 160 welds per minute.

No. 10-C Butt Welder

Capacity ¼ in. to ⅝ in. round, ⅛ x 2 inches flat, stroke of movable carriage, 3 inches.
Adjustment of clamps, 1¼ inches.
Vertical adjustment of fixed carriage, ¾ inch above and below movable carriage.
Tilting adjustment of 10 degrees.
Transformer capacity, 10 K.W.
Height, floor to dies, 32 inches.
Will weld any length Butt or Tee.

Ask for catalogue. We are in position to build machines for any special work.

"STERLING"

HACK SAWS

Manufactured by

Diamond Saw and Stamping Works
BUFFALO, N.Y., U.S.A.

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use **two** files where they heretofore only used **one.**

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

Nicholson-Made-Files

Brands

Kearney & Foot **Great Western**
American **Arcade** **Globe**

PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

Canada Wire & Iron Goods Co., Hamilton

We also manufacture

Wire Cloth for all purposes
Concrete Reinforcement
Molders' Riddles and Bellows
Metal Clothes Lockers
Steel Factory Stools
Window Guards
Ornamental Wire and Iron Work

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption reduced. Eliminates heavy shocks and vibration. Cost of repairs

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

Who Wants Your Order?

¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

The "No-Wear" Nozzle
An exclusive feature of the "Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

SHOP COMFORT

Give It to Your Men

Here is shown part of a row of our two-tier lockers.

This style is giving good satisfaction in some of the biggest shops in the Dominion.

They are more economical than the single locker, and can be built either back to back or back to wall.

Let us tell you how little it would cost you to give your men the advantage of these individual, sanitary, theft-proof lockers.

"A Pleasure to Operate This Machine"

Says an experienced Boring Mill Hand

A Few of the Reasons:

1. All controlling levers within arm's reach.
2. Power rapid traverse may be instantly engaged to either vertical or side heads.
3. Twelve speeds controlled by two levers located directly below table.
4. Speed levers so conveniently located and easily operated that they can be controlled as readily by foot as by hand.
5. Gearing of new selective, sliding gear type.

P. & W. 36-44 inch Side-Head Boring Mill

Heaviest and Most Powerful Boring Mill of Equal Capacity Ever Placed on the Market.

6. Control levers in all cases are advanced in direction which movable member is to travel.
7. By one lever, operator can instantly engage either feed or power traverse or shift from one to the other.
8. Complete absence of exposed gearing or other moving parts which could cause injury to operator.
9. Complete system of flood lubrication includes all gear units.
10. Starting lever operates vertically so that after releasing from upper position it drops by its own weight and table brake is automatically engaged.

Write for new circular, "The Side-Head Boring Mill."

This Micrometer Saved Over 40 hours of his time!

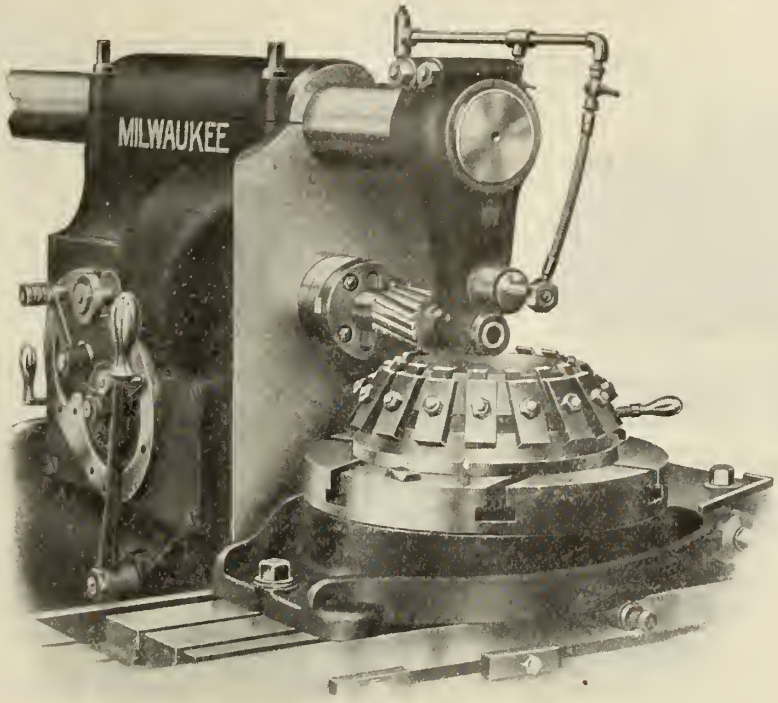
On a job of turning 5,000 pieces, each having five different diameters, this micrometer was substituted for the several ordinary micrometers previously used by this mechanic on this kind of work. The saving in calipering with the

Starrett

Quick Adjusting Micrometer

was easily three seconds for each diameter, and each diameter was calipered twice, making a saving of 3x5x2x5000=150,000 seconds or more than forty hours. This is far more than the cost of the tool saved in that one job. Can you afford not to be familiar with Starrett tools?

The secret of the quick-action is the plunger in the end of the spindle which, when pressed, permits the micrometer to slide to its adjustment.



Starrett tools may be seen at any good hardware store or send for our big, new, free catalog No. 203 and learn what tools your work requires.

Starrett Tools and Hack Saws are sold at all good hardware stores. 42-281

The L·S·Starrett Co·Athol·Mass·

World's Greatest Toolmakers

Continuous Milling of High-Speed Tool Steel on a Horizontal Miller

Last week we showed an interesting continuous milling operation on a vertical miller. This week it is on a Milwaukee No. 1B Horizontal Miller equipped with rotary table.

The parts are of high-speed tool steel and are for use as blades in the cutters that we manufacture. The operation consists of beveling the front edge of the blade.

In the fixture, a very simple one, the pieces are held down by a strap fastened with a nut. A more rapid fixture could be had at a slightly increased expense by substituting some quick-acting cam for the nut.

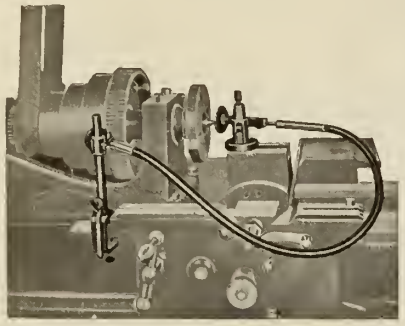
Even as it is, the rate of production is far in excess of production by any other method. The cutter is constantly in the work. The rate of production is fixed by the rate of the machine, consequently the operator must maintain the pace, taking off finished parts and putting on rough ones as fast as the table revolves.

This is one of the many jobs which bring out the importance of the cutter lubricating system of Milwaukee Millers. Efficient cutter lubrication is desirable in most cases. When working on high-speed tool steel (as in the job shown) it is absolutely essential, if anywhere near maximum production is to be secured and if the cutter is to retain its keenness for a long period.

By means of a pump in the interior of the machine, oil (or other lubricant) is raised from a reservoir in the machine. It is cascaded over the cutter, cooling it and washing away the chips. The lubricant is caught by the pan-shaped base of the rotary table and carried to the return pass-

ages in the work table. It flows through screens to remove the chips and is returned to the reservoir in the base of the machine by telescopic tubing. The reservoir for the cutter lubricant is entirely separate from the reservoir for the oil by which the gears and bearings of the machine are lubricated and flushed. Any lubricant can thus be used for the cutters.

Every Milwaukee Miller is equipped with pump and other equipment for lubricating the cutters. We do this because we can make better arrangements for pumping, returning, and storing the lubricant when the system is made part of the original machine. Every milling machine is bound, sooner or later, to be put to work on jobs requiring effective cutter lubrication.



The cutter lubricating system of Milwaukee Millers is patented. Other features include:—

One piece, box section, semi-steel column, heavily ribbed. One piece, box section, semi-steel knee, with solid top. Flanged spindle. Cascade lubrication of all gears and bearings. All gears and bearings in Milwaukee Millers are made of hardened steel. We build all geared, constant speed drive milling machines only—no cone pulley type. We are the only milling machine manufacturers who can make that claim. The swift march of machine shop progress is bearing out our wisdom in discarding the cone pulley and devoting our entire energies to the constant speed miller.

Get the complete facts about these result-getting machines. Write for our Bulletins. We are pleased to have you consult us on any milling problem.

BLOWER DEPT.

Judge a Drill by the Holes It Makes—

Get this thought firmly fixed in your mind, "There is a difference in drills."

Users of WILT TWIST DRILLS find that they get more holes of a given size per dollar of cost than they ever got with any other make.

And there is a very logical reason for it.

WILT TWIST DRILLS are made by a new process that insures absolute accuracy and uniformity. The contour of the grooves is scientifically determined—the clearance is clean-cut and well defined—and the hardening is done electrically and with scientific exactness. The machining of WILT TWIST DRILLS is done complete at a single chucking.

Are you prepared to meet the demand in your locality? Send us your order to-day.

J-M High Temperature Cement

Prolongs Life of Furnace Lining

Actual experiments have proven that when J-M High Temperature Cement is used to set up the fire-brick, they last several times as long, and little, if any, patching or repairing is necessary. This means a saving in labor and cost of operation equal to many times the cost of the cement, because fire-clay and like materials, which readily fuse and run when subjected to intense heat, necessitate frequent repairs, involving expense and delay.

J-M High Temperature Cement will save you this extra expense for maintenance and make your fire-brick walls permanent.

You can save money by preventing fire-brick troubles. Our nearest branch will tell you how if you write, giving type of furnace, temperature and troubles you experience.

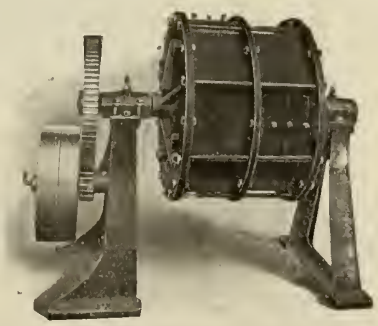
The Abbott Way



is the logical way to finish all your small parts.

Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.

If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

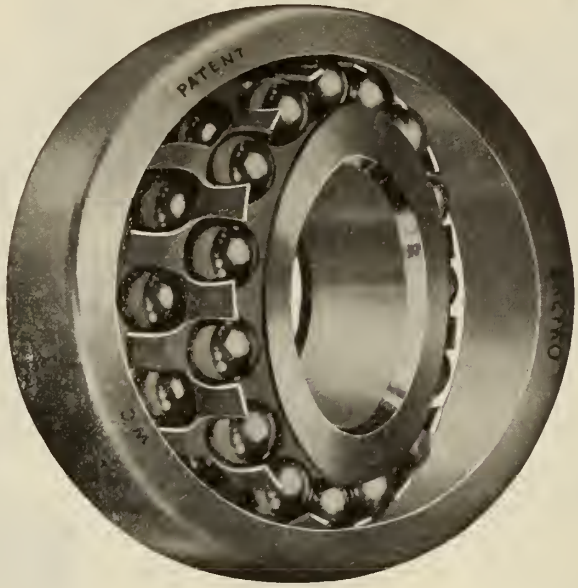
Little Giant DIES Little Giant DIES

These Signs of the Times

Point the way to economy and independence in shop results.



One-half the troubles in Assembling Departments are due to screws that don't fit. You must not expect ordinary taps and dies to produce interchangeable work. They are made on the "scant" or "full" way of measuring and are allowed altogether too much "leeway" to be dependable.

Get L. G. taps and dies—carefully inspected by close-limit gauges—guaranteed to cut interchanging threads—and your foreman will not need to spend half his time working over unfit screw threads. TRY THEM.

Made in GALT, Ontario

CANADIAN TAP AND DIE COMPANY

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Toleration Limits in Interchangeable Manufacturing

By John Edgar

The establishment of proper limits in the process of manufacturing does away with the exercise of the operator's judgment, besides eliminating the scrap pile and reducing production cost. The primary determination of limits should be, however, the work of one who knows thoroughly the requirements of the particular case.

THE success of modern manufacturing is based on interchangeability of the product both as a whole and in its details. Interchangeability to be practical is dependent on the toleration of variances in the sizes of the parts which when assembled make up the whole mechanism, unit or machine. Variance is the difference in the dimensions of the part from the specified or nominal figure. This variance must be kept within a predetermined limit in order that the parts will assemble without fitting, and must be carefully determined in order that the cost of manufacture be held down to the lowest possible point, and, at the same time, the quality be maintained.

Interchangeability is often misconstrued to mean and to be applied only to the most accurate work, and for a long time was considered to apply to precision work only, whereas it is entirely of a different nature. Interchangeability in precision work is the result of having the dimensions up to the specified figure without variance and having each part an exact duplicate of any similar part. From this we may judge that precision work is a rare thing, and what is commonly called precision work is merely interchangeable work made to narrow limits. Precision work will in most cases be found only in the most accurate tools, whereas interchangeable work is applicable to any class of product from the manufacture of farm machinery to the finest watches, and is all based on the same principle—that of toleration limits.

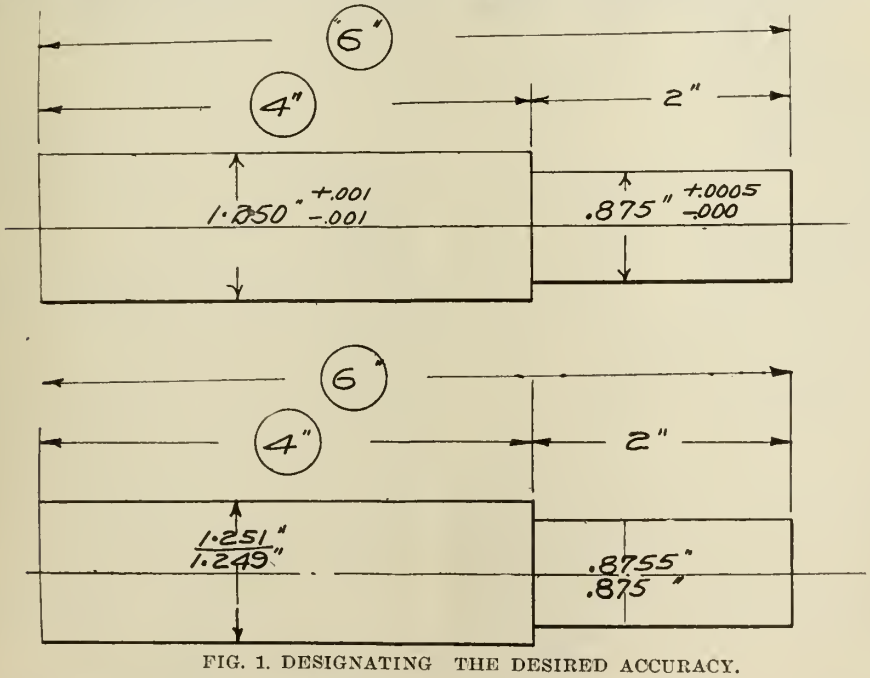

FIG. 1. DESIGNATING THE DESIRED ACCURACY.

Selection of Limits.

The range of the limits is to a large extent the result of previous experience, and in many cases will have to be changed in the course of time to check up with other elements that enter into the manufacture of a product. It is the intention here to point out some of the considerations that have to be met in the selection of the limit, and to correct the erroneous idea that the limits may be set arbitrarily to some fixed rule in which the peculiar conditions of each case are to be ignored.

The conditions that enter into the proposition of fixing the toleration of sizes are many in number, and may include the following:—

The design of the part; the work it has to do; its relation to other parts with which it works; the accuracy of movement; wear and its effect on the function of the part and its relation to the action of the mechanism as a whole; lubrication and its reliability; method of manufacture; the economical accuracy that can be maintained in the manufacture of the part and in those with which it is connected; the effect of temperature on the part as developed by the action of the part or its associates due to friction; maintenance of the alignment of the parts or their bearings, etc.

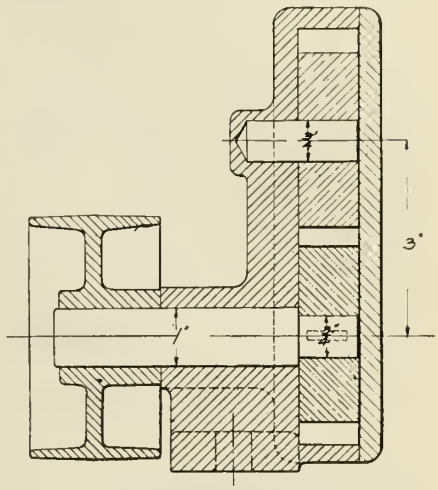

FIG. 2. SECTION THROUGH BODY OF GEARED PUMP.

The paramount consideration in the manufacture of a product is to make it in an economical way so as to answer the purpose in the best manner possible at reasonable cost. To do this, the product must be made in sufficient quantities to warrant the expenditure of a considerable amount of money in the making of jigs and fixtures to handle the work expeditiously so that the unit cost chargeable to the fixture expense is small per piece. Having made provision for the manufacture of the parts in quantities, the question of assembling the units must be considered. Before the jigs and fixtures are made, the question of the closeness of the sizes is to be considered, as the accuracy and the cost of the fixtures, as well as their design, depend on the determined limits of manufacture. We see, therefore, that the establishment of the limits is the first consideration after the design of the product is decided upon and some changes even in the design of the parts or the mechanism may have to be made when the toleration limits are studied.

The common use of the micrometer is liable to get one into the habit of working to too close limits in many cases where a wider range of tolerance is permissible, and much time is wasted on the production of many machine details because of the absence of the limiting sizes, and all work should be made with the permissible limits of variance in mind. These limits should be on all

drawings, especially when parts are made in different departments and assembled in still another. The too close working to the dimensions on the drawing is as bad as careless working, for, without some way of designating the permissible variance, there is no common basis.

Designating the Desired Accuracy.

To designate the accuracy expected in a part, the dimensions are put on the drawings with this in view. Thus, when dimensions appear in ordinary fractions, with the tolerance indicated either by writing the two dimensions within which the size is to be made or by giving the nominal dimension of the part and stating the plus and minus variance above or below which the size must not measure. The latter is more common practice. These methods are illustrated in Fig. 1. When a size is given in a decimal only, without limit, the size is meant to be held to that dimension without limit, and we have a case of precision work. There are many drawings

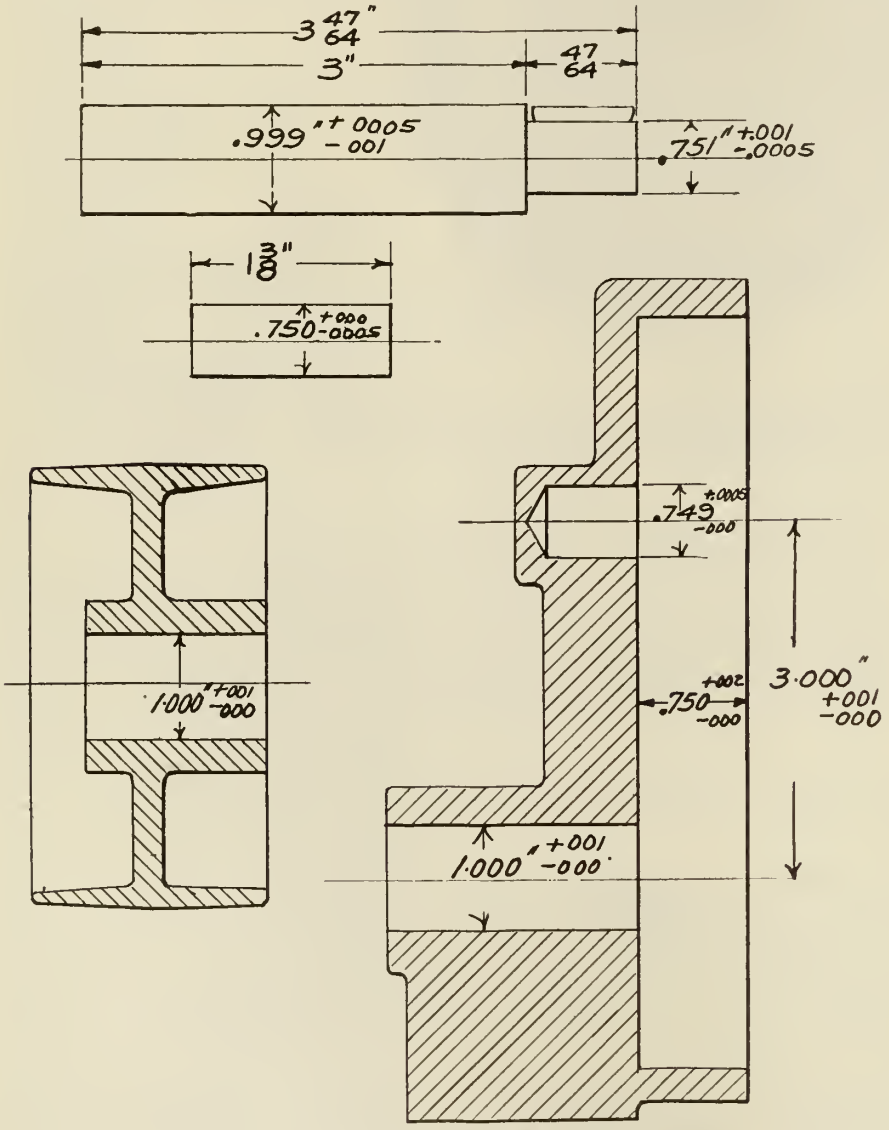

FIG. 3. DETAILS OF GEARED PUMP DIMENSIONED FOR PRODUCTION DEPARTMENT.

the accuracy is to be assumed to be as close as is possible with the engine divided scale, and may be taken to be either .005-in. larger or ..005-in. smaller than the nominal sizes. Some instances in which it is desired to indicate wider variance, the dimension is placed within a circle, which is meant to read inches, a variance of 1/64 in. above or under being tolerated. Dimensions that have to be kept within closer limits than .005 in. over and under are written in decimals

put out which have no means of showing whether the work is precision work or not, and no up-to-date manufacturing concern will take a job to do in which some limits are not given either directly or implied. The term "ordinary commercial limits" is rather a vague quantity, and is the cause of a great deal of litigation and misunderstanding.

The maintenance of the sizes indicated on the drawings is made possible by the use of limit gauges on a large class of work, while the use of the micrometer obtains on the majority of cylindrical work and on such work that would not warrant the expenditure of the amount of money necessary for special gauges for short orders.

In establishing the toleration of variances, the fact that the maximum size of the entering part must not exceed the minimum size given for the receiving dimension may seem an unnecessary precaution to note, but while this is so, in many cases the reverse is found on the drawing. On the other hand, the minimum of the entering piece must not be so low as to cause undue play in the joint when the two extremes are assembled.

Practical Example.

As an example of the method that will bring the best results, let us take the case of the parts in Fig. 2, which is the section through the body of a geared pump, the dimensions being the nominal sizes as they would appear on the general design drawing. The parts in detail are then fully dimensioned for the production department, and appear much as shown in Fig. 3.

Take the shaft which is made with two sizes—one for the pulley and bearing, and the other for the gear; the 1-in. size is to have an average measurement of .999 in. between the limits of plus .0005 in. and minus .001 in., making a variance of size of one and one-half-thousandths inch. These figures are chosen from the fact that most reamers cut about one-thousandth large when new, and that the space for the lubricant should never be less than one-half-thousandth, and the hole should never be under the nominal size of 1 in. The hole is made with an allowance or tolerance of one-thousandth, which under ordinary usage gives the reamer an economical life. The maximum difference between the shaft and the hole is two-thousandths, a permissible shake in a case of this kind. The average of all the product will have an oil space of one-thousandth. As the shaft is ground, the limits are well within present practice in economical production.

Had we made the limits with the same toleration above and below the nominal size of the shaft and hole, we would have had some shafts that would not enter the hole, and, consequently, would require fitting which is not, in the true sense, interchangeable production.

The fit for the gear on the end of the shaft is nominally ¾ in.; but since this is to be a light press fit, the average size for the shaft is given as .001 in. larger, or .75 in., with the variance of .0005 in. above and the same below the average. The hole in the gear is dimensioned an average size of .750 in., with the usual limit of .001 in. above and .000

in. below. This makes the extreme sizes for the shaft and hole vary from a fit of .001-in. drive to a light push fit, with hole and shaft of same size. This latter is not likely to obtain, as the shaft will be kept above the lower limit in the general run of work.

The case of the pulley is different, the hole being kept within the usual limits for holes, and being dimensioned .750 in. + .001—.000. The shaft is made the same size the full length of the 1 in. part, and the variance in the fit of the hole in the pulley and the shaft is from one with .003-in. shake to one with .001-in. play. This is a loose fit, but, as the pulley is held with a set screw, it is permissible.

In the case of the stud, the limits are closer. This is so as to get a force fit in the hole, the limits for which are also made closer, being .750 in. + .0005—.000. In this way the total tolerance in the fit is but one-half-thousandth. The tolerance in the fit of the idle gear on its stud journal is .002 in.

These instances of different fits show the use to which the established limits are put, and is the only safe way to carry on a manufacturing business in which quantity production is the idea. The establishment of proper limits does away with the human element in judging the allowance necessary for different classes of work, besides eliminating the scrap pile and reducing the cost.

The establishment of these limits must be made by one who knows the requirements of the case, because if done in a careless manner they are worse than none at all, as the additional care in working between the limits is wasted. The ultimate results, also, are liable to cause a disrespect for specifications on the drawings, and thereby tend to make them unreliable in their proper sphere as working data. The confusion resulting from such a condition is much met with in many small establishments in which little or no system, as indicated, is found. It places these small shops at a disadvantage when competing with the larger and better handled concerns.

The natural companion to the system of the limits is that of competent inspection. It gives the inspector a field in which to work, with stated limits within which a tolerance of variances is allowed.

Observations on Breakdowns of Gear Drives

By Michael Longridge

The accompanying article is an abstract from a paper read recently before the Graduates' Section of the Institution of Mechanical Engineers. The fact that faulty design and careless installation have played an important part in many "smash-ups" makes the data here given of considerable value to those whose work lies in these particular directions. The author is the well-known Chief Engineer of a large and leading machinery insurance corporation.

SPUR GEARING.

ABOUT 1879, when horizontal engines of 800 to 1,200 I.H.P. began to replace beam-engines of half that power in cotton mills, when pitch-line speeds were rising from 1,800 ft. to 2,300 ft. per minute, loads on teeth from 10,000 lbs. to 18,000 lbs., and gear ratios from 2¼ to 1, 3 or 3½ to 1, an epidemic of breakages of spur-gears set in. Some 20 per cent. of the engine breakdowns were breakages of spur-wheels on engine crank-shafts, and the pinions driven by these wheels broke almost as frequently. Many of these breakdowns were due to irregularities of pitch, twisted teeth, sinuosities of pitch circles, concentration of pressure on the end of teeth through movement of crank-shaft, back-lash from the momentum of rope-drums on second-motion shafts, and other faults of workmanship and use, common to old-pattern moulded wheels and to old engines.

The damage, however, was not confined to these. Many new wheels, as good as mechanical skill could make them, with teeth moulded by machinery, spur-runs, cast in complete circles, and machined internally, carried on crank-shafts held in pedestals, with brasses adjustable horizontally as well as vertically, broke also. These breakages were usually attributed to "vibration," "wear and tear," "teeth bearing up to points," and similar effects of a cause ignored or not discerned. That cause, in my opinion, was the use of teeth too long and too wide to "correspond with their environment," the most important fact of that "environment" being the unavoidable motion of the engine crank-shafts on which the driving-wheels were hung.

Spur Gear Breakage Explanation.

I will try with the aid of Figs. 32 to 35 to make this clear. Fig. 32 represents three teeth (A), (B), (C), of a spur-wheel geared with three teeth, (D), (E), (F) of a pinion. The teeth are supposed to be cycloidal, for involute teeth have not found favor with makers of main driving-gear. Their length is exaggerated to make this illustration clear. Similar profiles can be set out, according to the rules in the books to provide three points of contact (x), (y), (z), and three teeth to carry the load. They look very pretty upon paper, but they will not work if the spur-wheel (A), (B), (C) be forced towards the pinion (D), (E), (F), by the motion of the shaft.

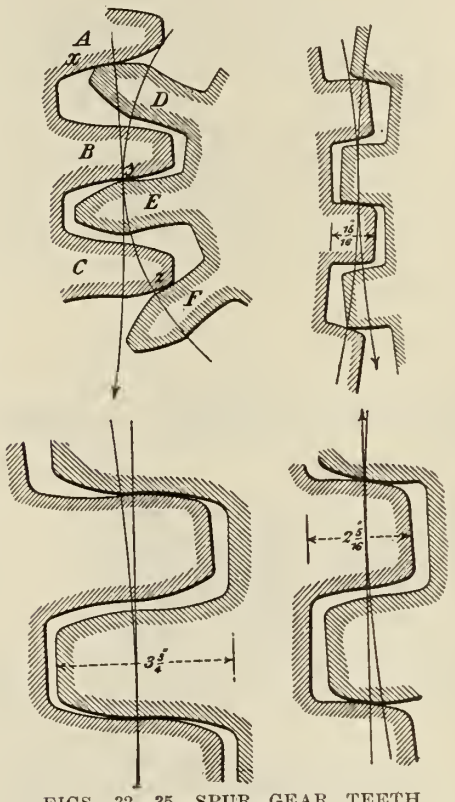
The contact at (y) ceases. The pressure is taken off (B) and is concentrated upon the points of the teeth (C) and (D), and there intensified enormously by the forcible retardation of the driving-wheel or acceleration of the pinion. Again, even if the crank-shaft could be held absolutely steady, the same effect might be produced if the teeth came from the mould full at the points, or if the pitch-line had proud places, both common defects in uncut wheels. If, however, the faces of the teeth were cut away sufficiently to limit the contact to the immediate neighborhood of the pitch-point (y), the motion of the wheel towards the pinion would simply cause the tooth (B) to slide on (E) without strain or change of angular velocity.

Of all intermediate positions of the point of contact it may be said that the further it moves from the pitch-point, the more destructive become the effects of shaft displacements, incorrect tooth forms, or sinuosities of pitch lines, and conversely the shorter the path of contact the less the mischief resulting from these unavoidable irregularities. Experience has led millwrights to the same conclusion, for they invariably set out wheel teeth so fine at the points and roots that they bear only near the pitch line when new, and when through wear the bright bearing surfaces extend to the points of the teeth, they chip the points to avert the damage just referred to.

The question is, why do they leave surfaces which are not used when the teeth are new and which have to be chipped off when the teeth are old To this I never could get a satisfactory answer. Neither as far as I know, would wheel makers cut short their teeth till 1888, when a firm of engineers consented to make a pair of wheels with short teeth, Fig. 33, for their own shop engine.

These wheels must have felt like the first lady who appeared in public minus a crinoline, so greatly did they differ from the fashion of their day. They had 49 and 47 teeth, of 2 5-8 in. pitch, 15-16 in. long and 4 1-2 in. wide, the ratio length to pitch being 0.36. With fixed

centres and accurate moulding, teeth 1-4 in. long would have kept contact. These wheels held their grease well and ran smoothly, till the engine was replaced in 1892. They were but small, and running at a low speed (1080 ft. per minute), but they were more convincing than arguments or drawings, because they were made of cast iron and could be seen at work.



Figs 34 and 35 show what they accomplished in a few months. The former shows the teeth of a wheel and pinion installed in November, 1888, after two other sets of gearing had been destroyed in the space of eleven years. The teeth were 4 13-16 in. pitch, 3¾ in. long, and 19 in. wide, while the distance between the centres of the shaft-bearings was only 66½ in. With these dimensions and a pitch-line speed of 2410 ft. per minute, the motion of the crank-shaft threw the whole load of 16,400 lbs. upon the corners of the teeth and drove the points of the pinion-teeth into the flanks of the wheel-teeth with jar and vibration sufficient to break one of the segments in the following March. Then more teeth were cracked and more segments broken, and it became necessary to replace the entire rim. The new rim was made of steel, with teeth of the same pitch and breadth as the old, but 2 5-16 in. instead of 2¾ in. long, Fig. 35. They would have been better 1½ in. long.

The tooth of an engine-driving-wheel is a cantilever whose strength varies not as pitch^2 × width ÷ length, but as pitch ÷ length, because, with a short and moving crank-shaft, very little, if any strength is gained by making the width of a tooth more than one pitch. Thus a reduction of length to 1½ in. would have permitted a reduction of pitch to 3¼ in., an increase in the number of teeth in both wheels, a shortening of the necessary path of contact, and, if three pitches be considered a sufficient width for the teeth of one engine driving-wheel, as I think it is, less concentration of pressure on the corners from the lifting of the shaft.

Double Helical vs. Straight Teeth.

Some people consider double-helical teeth stronger than straight teeth. This is a delusion. Width for width of wheel-face, they are much weaker, because, owing to the lifting and end-long motion of crank-shafts, the pressure never acts on both treads at the same time, unless provision be made for allowing the pinion-shaft to move end-ways, and, even, then, the force required to overcome the inertia of the pinion and its shaft adds seriously to the pressure on the teeth. There is another cause of destructive vibration—namely, irregularity of pitch and inequality of pitch of wheel and pinion. The first is seldom important in machine-moulded wheels, and can generally be rendered innocuous by chipping and filing. The second, depending upon the contraction of the castings, can only be remedied by gearing the wheels more or less deeper than was intended by the designer.

In my opinion, both wheels of a pair should have pitch circles turned on both sides of the rims, with radii proportional to the number of teeth in each, whether they be the radii marked on the drawing or not. The wheels should be geared to these circles and kept there. The change of the position of the pitch-point on the profile will not materially affect the velocity ratio if the teeth be short. The fashionable length of teeth is now 0.45

FIGS. 32, 35. SPUR GEAR TEETH BREAKAGE FEATURES.

to 0.55 of the pitch, instead of 0.66 to 0.75 as formerly, and it might be reduced still more with advantage in many cases.

I should like to have said something about the breakages of spur-wheels other than breakages of teeth, but as most of the breakdowns of these wheels originate in the teeth, it seemed best to devote the time available exclusively to them. The breakages of spur-gearings are now 10 per cent. of the total breakdowns. The reduction in the percentage from 20 to 10 is principally due to the supersession of gearing by ropes. The improvements in design and workmanship have done little more than enable wheels to live under conditions which the old wheels could not have faced, but they have done something, and the substitution of steel for iron, of cut or milled for moulded teeth, and of shorter teeth and correspondingly finer pitches, will do a little more, but I doubt if it will ever be possible to transmit more than, say, 1200 horse-power from the crank-shaft of a steam-engine by spur-gearing.

NO RULES FOR SUCCESS.

WRITING in Pitman's Magazine, a new English publication devoted to business, A. E. Bull outlines the kind of people it is necessary for the man to know who would find success in the commercial world. Says Mr. Bull:

"A remarkably successful man, who had commenced in poverty and who had built up a world-famous business, was once asked to explain the secret of his success.

"'My dear man,' he said to the interviewer, 'it can't be done. I can no more tell you how I succeeded than a bird could explain how it learned to fly.'

"'But,' protested the interviewer, 'you surely have some rules of conduct and business methods that you have adhered to through life, and which would account for your success?'

"'Yes, I have rules,' replied the successful man, 'but rules are nothing. Success isn't a matter of rules. It's something inside a man, something that belongs to his nature and character. If a man has it, he will succeed; if he hasn't, all the copy-book headings in the world won't give it to him.'

"That was the opinion of a man who had succeeded and knew his own nature, and, up to a point, it has a great deal of truth in it.

"Here is a second reply to the question which was put to the millionaire. The man who made it was by no means so prosperous, but he had succeeded beyond reasonable expectations. He was certainly more successful than those who knew him best thought he would be, for he was not a particularly able man in any way.

"'I made one rule in life,' he said. 'I regard it as a duty to succeed, so I persistently sought the company of those who had succeeded. If a man was a failure I avoided him, not out of any snobbishness, but because I could not afford to run the risk of catching the infection of failure from him.'

"The things that bring success are the things that belong to character. To succeed one must mold the character aright. Nothing influences character so much as companionship. In his mind it worked out this way: Make companions of weak people and one becomes weak, make companions of strong people and one becomes strong."

Description of a Testing Plant for Centrifugal Pumps

A testing plant for centrifugal pumps has been built at the works of Canadian Allis-Chalmers, Ltd., Rockfield, near Montreal, which can be reckoned, without fear of contradiction, we believe, as one of the best equipped and most up-to-date hydraulic laboratories on this continent.

A CENTRIFUGAL or turbine pump is not a positive displacement pump and there are no "rule of thumb" methods of arriving even approximately at its capacity. It may be accepted then that a well-equipped testing plant is one of the most important essentials for the successful manufacture of centrifugal pumps.

From the manufacturer's standpoint the records of tests carefully carried out are of the utmost value, as they constitute the foundation upon which future propositions can be based, designs developed, improved and modified to suit particular requirements. From the purchaser's standpoint, on the other hand, is the absolute assurance that the hydraulic and efficiency requirements have been fulfilled and, secondly, that a trial run of several hours' duration will insure continuous operation of the machine with no mechanical difficulties arising after leaving the works.

There are a number of testing methods in use with varying degrees of accuracy, and they may be classified as follows:

(a)—Weight or volume method.
(b)—Weir method.
(c)—Velocity meters.

The last group includes Venturi meters, nozzles and the Pitot tube.

The instruments required, pressure and vacuum gauges to determine the total head; watt meters to determine input to motor, or indicator to determine horse-power of steam engines, have long been standardized and are usually accepted without question by consulting engineers and representatives of purchasers on official tests; in any case their calibration is a simple matter and facilities are provided for this purpose at the Rockfield Works. The measurement of the quantity of water being handled, however, presents many difficulties, because the methods generally adopted, owing to their cheapness, such as weirs, nozzles, pitot tubes and, in fact, all velocity meters, are open to the very strong objection that their accuracy depends on constants determined by experiment which, as far as consulting engineer or official representative is concerned, may or may not be right. A means of direct measurement either by weight or volume is an absolute necessity.

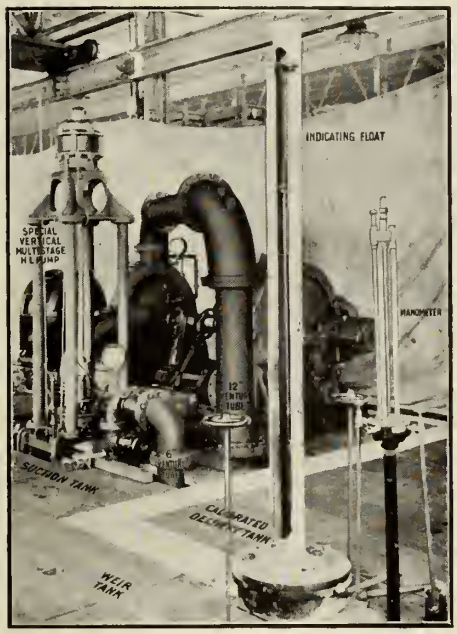


Fig. 2. CLOSE VIEW OF MANOMETER AND FLOAT.

Test Plant Details.

In the testing plant at the Rockfield Works, no one single testing method has been relied upon, but any one of the three above-mentioned testing methods can be used and the volume method can be used to check either the Venturi meters or the weir. It may be stated here that a testing plant established at the Mather & Platt Works, in Manchester, England, whose well-known centrifugal pumps, Canadian Allis-Chalmers, Ltd., have successfully manufactured for several years, served as a basis for the design of this unique equipment.

Figs. 1 and 2 represent general views of the testing plant and, referring to Fig. 3, the overall dimensions of the tanks alone, which are 34 ft. 6 inches long, 18 ft. 3 inches wide and 9 ft. 4

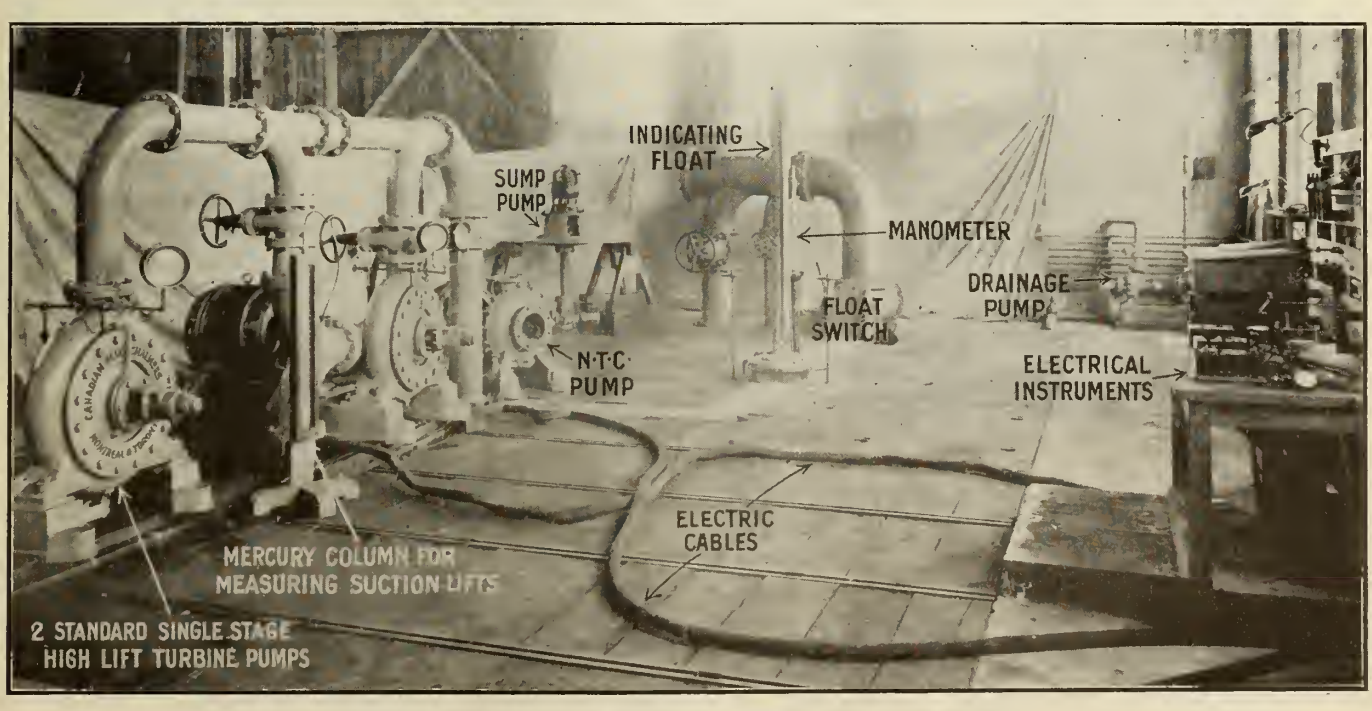

FIG. 1. GENERAL VIEW OF CENTRIFUGAL PUMP TESTIN G PLANT.

inches deep, will satisfy the reader that an equipment of such proportions is well able to cope with the largest pumping units. It can be seen that all tanks have been placed underground so that factory space is not wasted and the flooring made in such a way that the tanks can be easily uncovered. The total area has been divided into three tanks. The suction tank is 18 ft. 3 inches long, 15 ft. wide, 9 ft. 4 inches deep. The calibrated delivery tank is 18 ft. long, 11 ft. wide. 7 ft. 4 inches deep, and the weir tank is 18 ft. long, 5 ft. 9 inches wide by 7 ft. 4 inches deep.

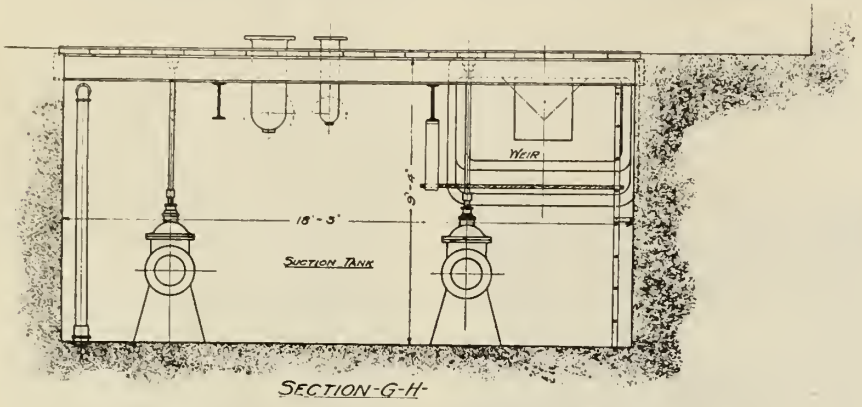

FIG. 4. CROSS SECTION OF SUCTION TANK.

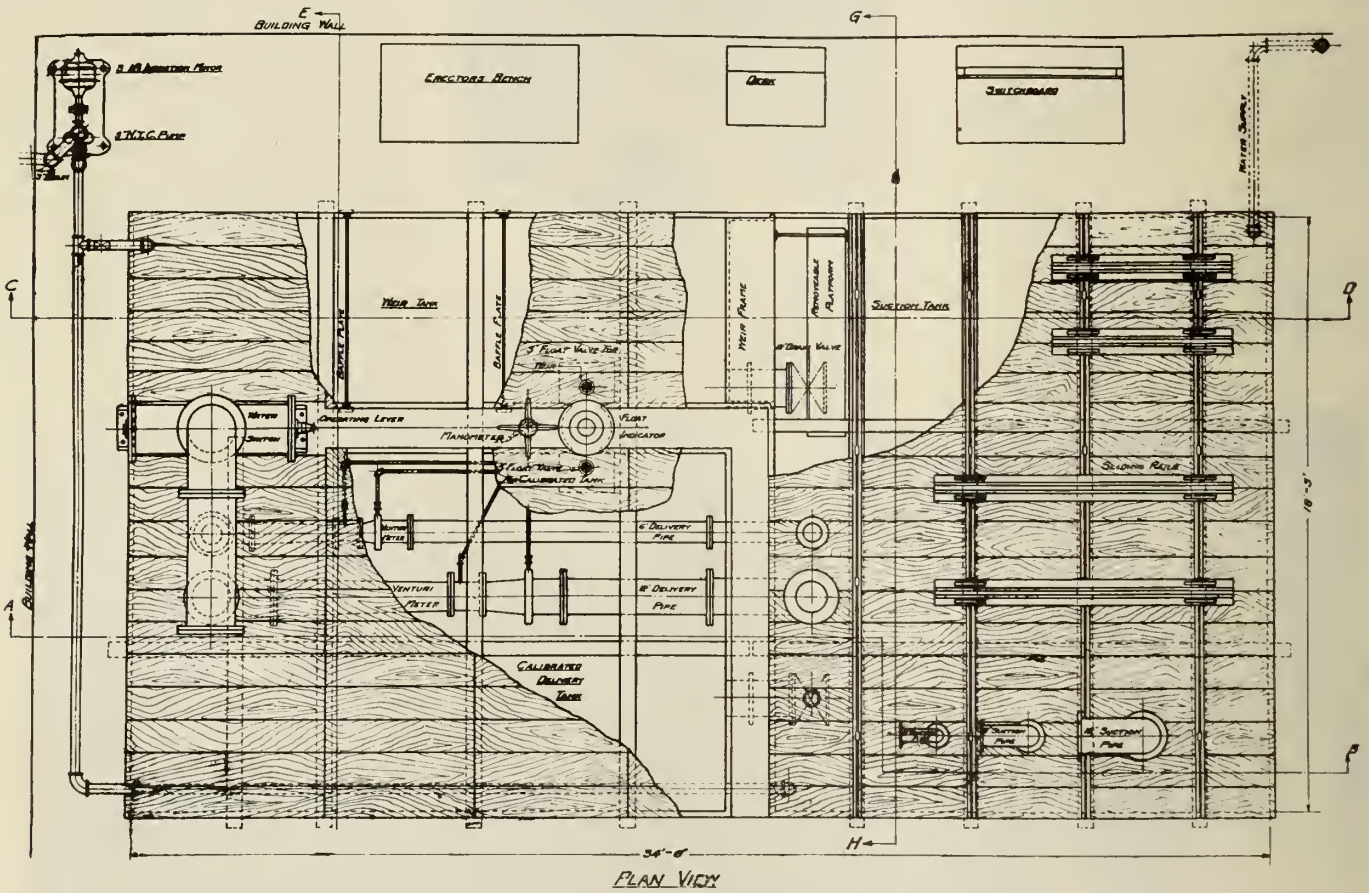
All tank walls are made of waterproofed concrete and the bottoms carefully leveled. By raising the bottom levels of delivery and weir tanks above the suction tank, they drain by gravity through connecting valves into the suction tank. A small motor-driven centrifugal pump, which can be seen in the right-hand corner of Fig. 1, serves as drainage pump for all tanks. Suction pipes with foot valves and strainers of various sizes may be noted in the suction tank, and little time is lost in making the suction pipe connections when pumps about to be tested are bolted to the cross rails, thus providing a firm setting-up.

The discharge connections are formed by two elbows, a 6-inch and 12-inch which connect to a 6-inch and a 12-inch Venturi meter respectively. Following the discharge pipes, they are carried to a common large pipe, which finally connects with a water switch, the function of which will be described later. By removing a blank flange, a passage can be made from the delivery tank to the weir tank. On the wall dividing the delivery tank from the weir tank can be seen a Manometer which, by means of pipe connections to the Venturi meter tubes, registers the amount of water flowing through the tubes. Next to this instrument is mounted a float with indicator which shows the height of water in either delivery or weir tanks by opening and closing valves.

Referring to the weir tank, the cast iron weir frame may be noted which is set in the wall dividing the weir tank from the suction tank. Weirs of the V-notch shape, and rectangular weirs of 18, 22, 24, 35 and 48-inch widths can be inserted in this frame. A ladder with a platform has been provided to allow the test operator to descend and observe the leveling and careful setting of the weir crest to the zero mark of the float scale. Baffle plates in the weir tanks can be raised or lowered in wall frames to best advantage to check any disturbances of the water and to insure a quiet flow near the weir. A table with the necessary electrical instruments to measure the



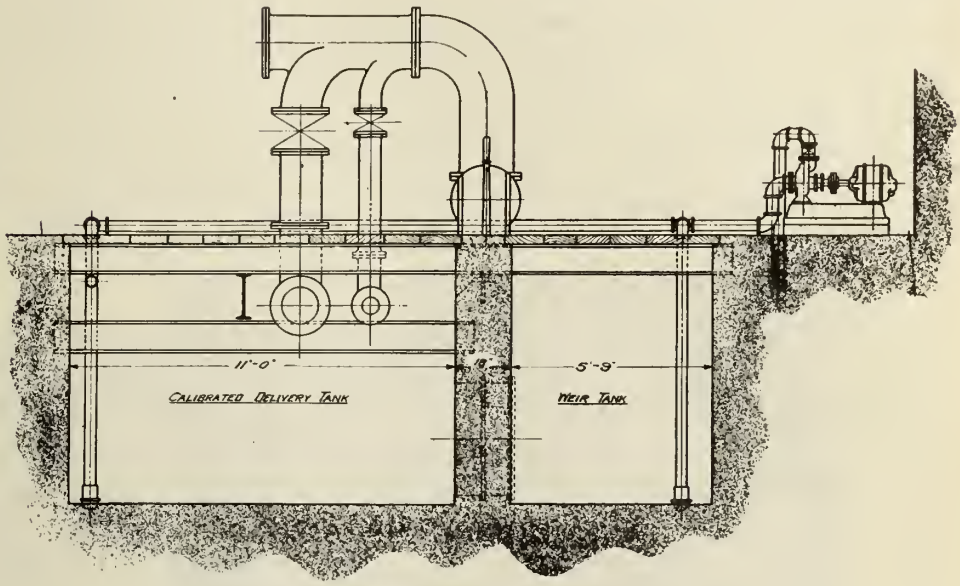


FIG. 3. PLAN OF TANKS SHOWING LAYOUT OF METERS AND PIPING.

electrical input, and engineer's desk and a fitter's bench complete the equipment.

Method of Test.

The method of test is as follows: All suction pipe connections are made with the above-mentioned pipes in the suction tank. The discharge connection is made with one of the two elbows, according to the size of pumps to be tested, and the water is discharged direct into the water switch. By operating the hand lever, the water can be instantaneously switched either into the calibrated delivery tank, or into the weir flume. As the name indicates, the delivery tank, although of uniform section, has been carefully calibrated by weighing the water and noting the rise of level on the float scale. Assuming that the operator by means of the water switch has directed the flow into the weir flume, he next observes the weir flume scale on the float and the manometer reading at the same time, thus checking the weir against the Venturi meter. The float is now closed to the weir tank and opened to the delivery tank. The level of the water in the delivery tank having been observed and, with stop-watch in hand, he throws over the water switch lever, allowing the water to fill up the delivery tank.

The operator allows the pump to discharge into the delivery tank for from say one minute in the case of ten thousand gallons per minute pumps to even half an hour if required for five hundred gallons per minute pumps, and noting the time, switches the discharge from the pump back into the weir flume whence it continues to circulate round. At his leisure, and when the water in the delivery tank is quite still, the operator observes the new level and, subtracting

SECTION-E-F-

FIG. 6. CROSS SECTION OF DELIVERY AND WEIR TANKS.

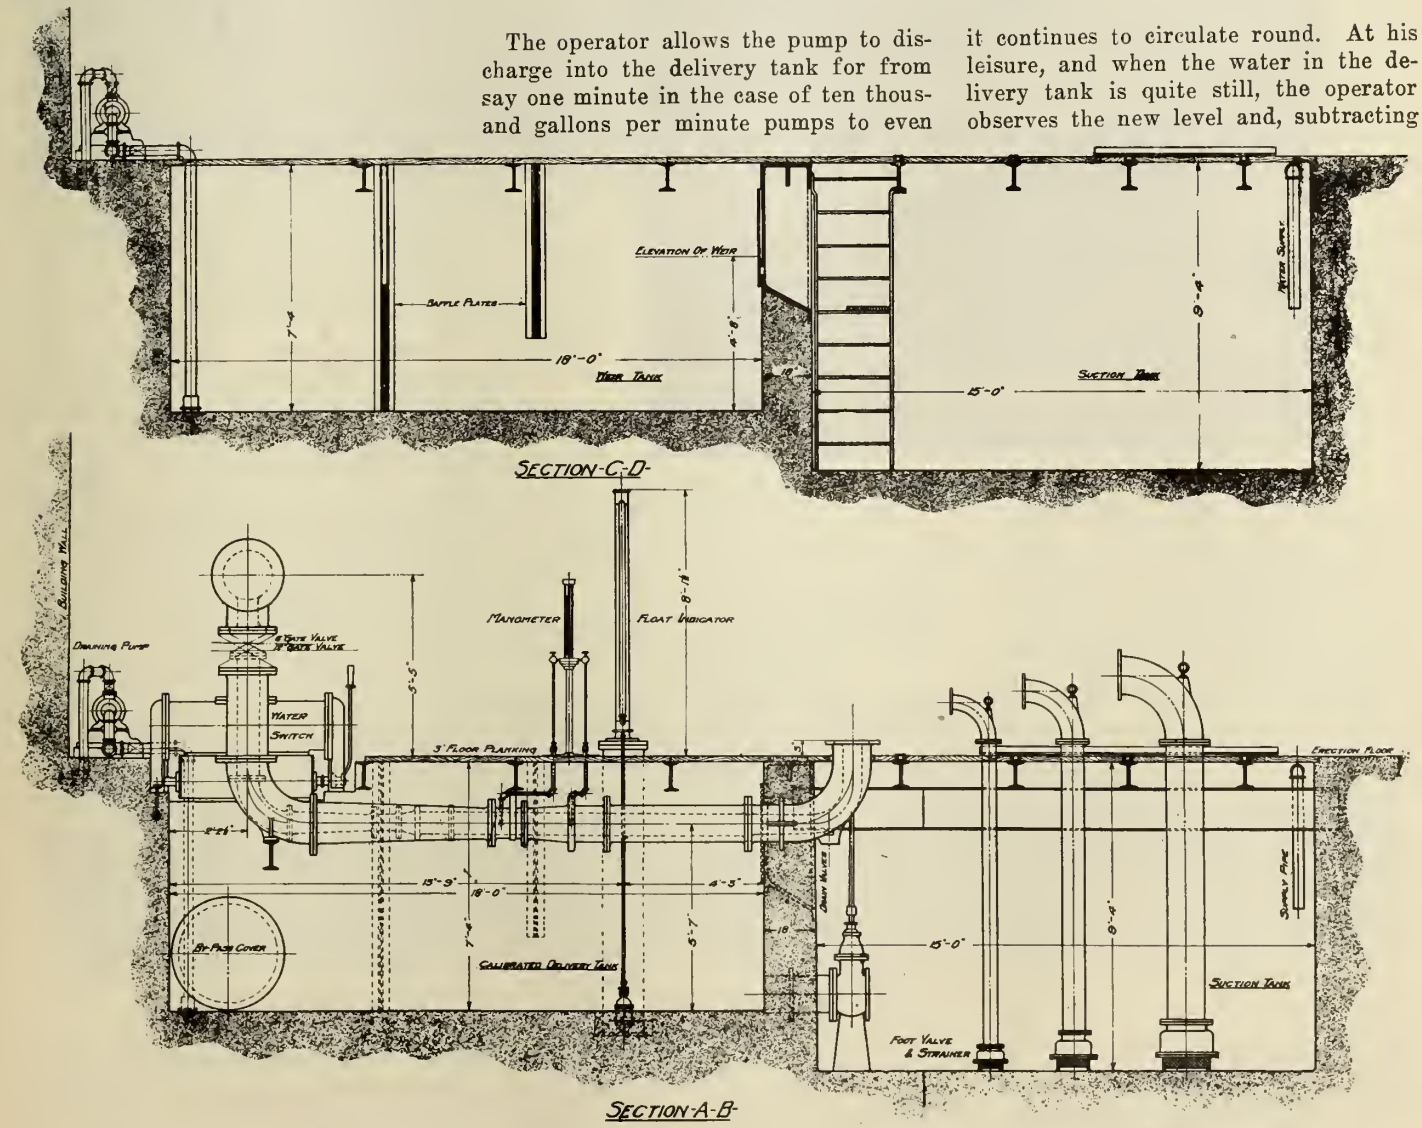

FIG. 5. SECTIONS OF WEIR, SUCTION AN D DELIVERY TANK, SHOWING SUCTION PIPES AND METERS.

it from the original level, arrives at an exact volumetric measurement of the water passing through the pump. Note here also that the water is still passing through the Venturi meters, thus checking them against the delivery tank. Thus, the Venturi meter checks the weirs, and the volumetric measurement checks the Venturi meter.

For quantities over 10,000 g.p.m. the discharge is delivered direct into the delivery tank through by-pass into the weir flume and over the largest weir which, having been checked up to 10,000 g.p.m. may reasonably be assumed to be exact for larger quantities.

FIG. 7. FLOOR REMOVED, SHOWING WATER TANKS AND WEIR.

Fig. 7 shows part of the flooring removed with water flowing through the water switch into the weir flume and over the weir.

Fig. 2 shows a closer view of manometer and float, also illustrates the possibility of preparing and setting-up, for test, two pumps at the same time.

There is also a complete electrical testing department, fully equipped for making all tests necessary to determine the performance curves of motors, up to the largest sizes. A Prony brake equipment is also available for testing the smaller sizes. Power is received in the electrical testing department from 3-wire d.c. factory circuit at 220 volts; is then transformed by means of suitable motor generator sets and transformers, and then relayed to the testing table in the pump testing department shown in Fig. 1, where the readings of power input to the machine under test are made. Direct current at 110-220 and 550 volts, and alternating current at all standard voltages and frequencies are available. The power available is 400 h.p. for d.c., and 60-cycle a.c. motors, and 200 h.p. for 25-cycle a.c. motors.

It may also be mentioned that steam inlet and exhaust pipe connections are available at the test plant and small or large steam turbine-driven pumps can be as easily tested as motor or belt-driven units.

"SAFETY FIRST" MOVEMENT IN MONTREAL.

At the present time there is being instituted in the city of Montreal the most comprehensive campaign ever outlined for the prevention of accidents. This plan, made doubly difficult by dual language conditions is being fathered by Mr. A. Gaboury, superintendent of the Montreal Tramways Co., and will embody aggressive operations for at least a year.

Circulars have already been issued to all the automobile owners in the city announcing and elaborating the campaign. Personal letters are to be sent to each of the five thousand cab owners and drivers explaining the plan, and asking his co-operation in the prevention of accidents. These will be followed, as soon as the staff of a dozen men permits, by letters to express drivers, chauffeurs, motormen, conductors and all employees of the Tramways Company. The envelopes will contain, besides a personal letter to the recipient, circular pamphlets setting forth the peculiar dangers which attend traffic on busy streets where cars operate; the possibility of brakes refusing to work, the effects of greasy or wet rails, and many other sources of accident that can be prevented by waiting until the car stops.

All spare space on bill boards and fences on vacant lots will be covered with attractively illustrated posters dilating on the advantages of caution. All trucks, express wagons, street cars and public autos will shortly be decorated with "safety first" signs. Every public school and college and every public office that will accept them will receive large calendars illustrating how accidents occur and how they may be prevented.

During the early part of the campaign, Mr. Gaboury will make a collection of all the moving picture films obtainable which depict accidents, their causes and prevention. These will be supplemented by a number of new ones specially prepared and will be shown in the club quarters of the Tramway employees as well as in the leading moving picture theatres. Special entertainments will be arranged for children who will be admitted on passes issued to the different schools in turn.

A series of weekly meetings for employees of the company will be addressed by the superintendent in the form of short lectures on the prevention of accidents. Instruction, drill and competitions for men in preventive measures will be inaugurated and branches of the St. John Ambulance Society will be established. Each of the men will wear small badges bearing the words "safety first" in both English and French.

Every article of the company's property, transfers, letter heads, notices, trolley sign poles, etc., will bear words of caution, and "Safety First" signs will be offered every other establishment that will accept them. School children will be presented with blotters, rulers, scribblers, etc., which will remind them continually of how accidents are caused.

Mr. Gaboury declares that the scheme is not soon to die a natural death, but that the company will continue to keep in touch with all firms and individuals affected. The circular letters will be repeated at frequent intervals and means adopted to prevent the novelty from wearing off.

MAIN SHOES FOR QUEBEC BRIDGE.

THE St. Lawrence Bridge Co., have just completed at their shops at Rockfield, near Montreal, the first of the four main shoes for the new Quebec bridge. Owing to the great length of span and consequent enormous weight of the bridge, these shoes are of extraordinary dimensions.

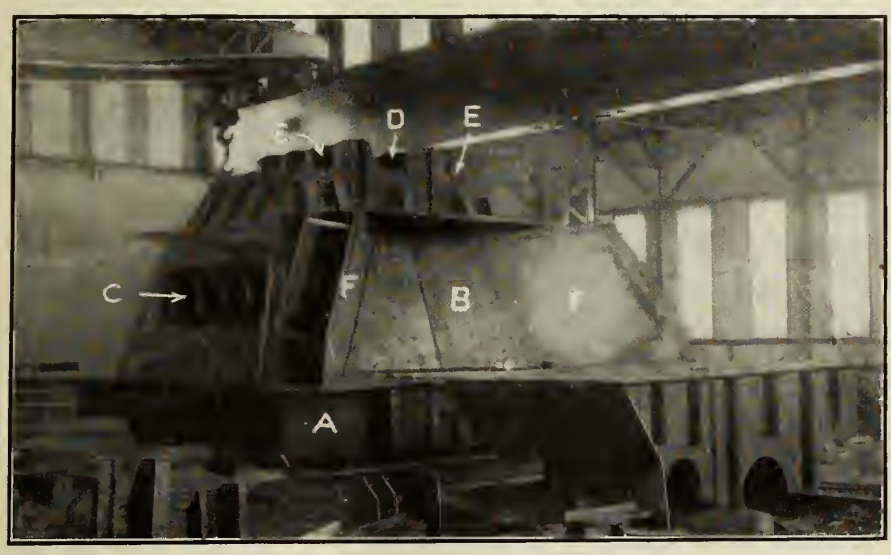

FIG. 1. FIRST OF THE FOUR MAIN SHOES OF THE QUEBEC BRIDGE ASSEMBLED IN THE SHOPS OF THE ST. LAWRENCE BRIDGE CO., MONTREAL, PREVIOUS TO SHIPMENT TO THE BRIDGE SITE. EACH SHOE WEIGHTS ABOUT 450 TONS.

The name "shoe" is a convenient short term to indicate the pedestal on which the whole bridge truss rests, and by which the weight is distributed over the granite masonry of the main piers. These piers are accurately leveled off, and on them is built a base or grillage of steel castings. These castings, which may be seem at (A) in Fig. 1, are four feet high. Four of them are bolted together under each shoe, forming a base 26 ft. 4 in. long by 20 ft. 10 in. wide. Each casting weighs rather more than 40 tons.

On top of these castings comes a middle section (B). This is 9 ft. 5 in. high, and consists of four webs built up of steel plates, each web being 8 9-16 inches thick. These are strongly reinforced with angles and are braced to each other by diaphragm plates. At each end is bored a semi-circular hole, 45 inches in diameter, seen at (C). This hole receives a forged bushing or sleeve for a 30-inch pin, through which the bottom chords of the trusses transmit their stresses. This middle section weighs 143 tons, and has consequently to be shipped in two sections. It is split longitudinally and two ribs only are handled at one time. When placed in position at the bridge site, the whole will, of course, be solidly riveted together.

The top portion of the shoe also consists of four webs built up of plates, but is only 5 ft. 5 in. high. It has one 45-inch semi-circular hole (D), at the centre to carry the main vertical post of the bridge, and two 30-inch holes (E) on each side to receive the main compression diagonals. The centre pin is 30 inches in diameter and the side pins 20 inches. Each rib has a side bearing 7⅝ inches wide at the main post and 5⅝ inches wide at each diagonal connection. The top section is handled and shipped as one piece and weighs 58 tons.

The large wing plates (F), seen projecting from the middle section (B), are the connection plates for the lateral bracing which ties the two sides of the bridge together at the bottom. The height of the shoe, including the cast steel base, is just 19 feet. The total weight of the structural steel portions is 280 tons, while the cast steel grillage weighs approximately 170 tons, making a total weight for the complete shoe of about 450 tons. It will be called upon to carry a normal dead load of 18,500 tons, half of which comes in from the main vertical post. The live loads of trains, combined with the effect of a violent storm, may cause this load to be doubled on any shoe, giving a maximum load of 37,000 tons. The position of the shoe in the structure is seen in the picture showing the bridge as it will appear when completed.

The main span has a length of 1,800 feet, while the clear height above high water wark is 150 feet. The main vertical post is 310 feet high and there will be approximately 65,000 tons of steel in the structure, which will rank as one of the heaviest bridges in the world, in addition to having the longest span in existence.

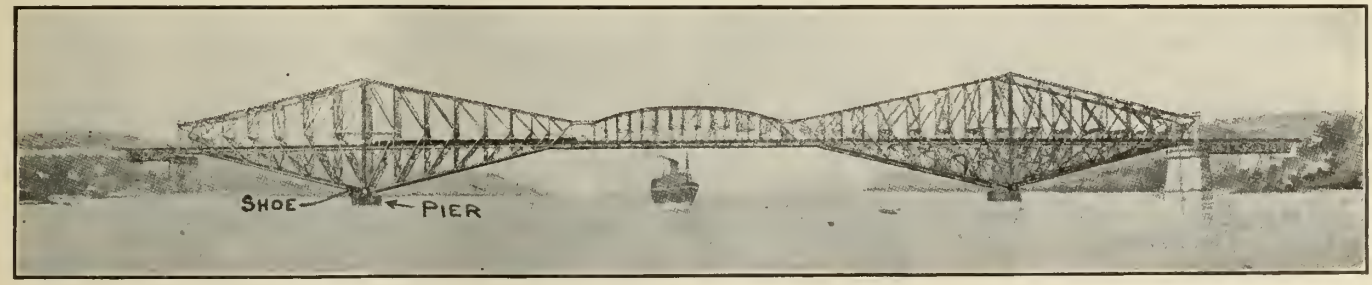

FIG. 2. VIEW OF QUEBEC BRIDGE WHEN COMPLETED, SHOWING LOCATION OF MAIN SHOES.

SELF-CONTAINED BORING BAR.

By J. P. Sanderson.

WE show herewith, Fig. 1, a useful boring bar that has been thoroughly tried out in a Western shop. The body (B) is made of round stock of the size desired, and preferably of a moderately high carbon material. The ends are slotted with square holes to hold the

tool (T). The one shown is cut on the angle for a bottoming tool. The tool slot at the other end of the bar is best made square, with the bar. The bar is also drilled for the hardened pin (P) and slotted for the hardened taper key (W). The wedge key (W) is kept from falling out and becoming lost by the pin (A) driven through it.

This bar is intended to be used in a cast-iron clamping head for the tool rest, and at least one of the wedges (W) should be made short enough to pass through it. The bar is self-contained. The operator simply tightens or loosens his tool by a tap of the hammer, and no wrench is required.

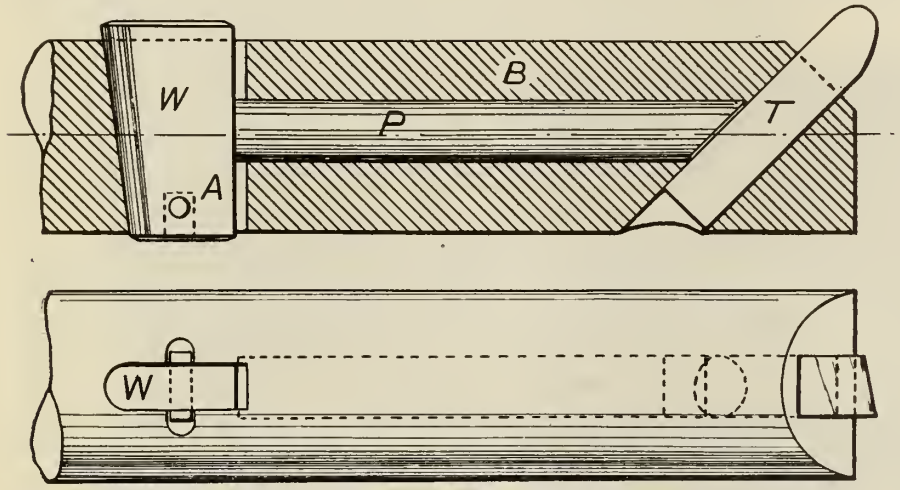

FIG. 1. SELF-CONTAINED BORING BAR.

Cutter for Multiple Boring.

Fig. 2 shows a simple method of making and holding sizing or roughing cutters, being particularly useful where several holes are to be bored in line. The bar (B) may have as many tool slots as there are holes to be bored, while the tools (C) may be quickly changed from roughing to finishing or vice-versa, by tapping out the wedge (K).

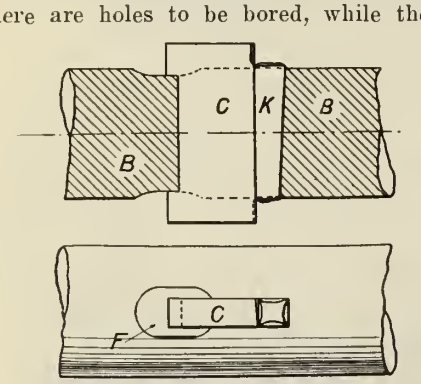

FIG. 2. CUTTER FOR MULTIPLE BORING.

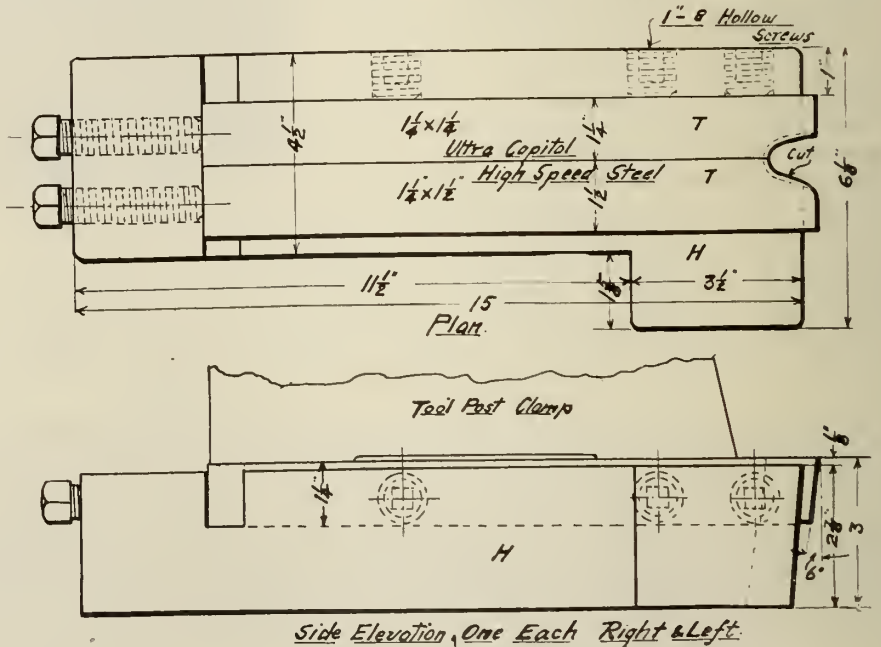
This tool was very successfully applied by grinding the roughing tools to cut on the back or wedge side and the finishing tools to cut on the front or opposite side while rotating in the same direction. In operation, five holes were finished simultaneously in a horizontal boring machine by feeding backwards for the roughing cuts, replacing with finishing cutters and simply reversing the feed.

FLANGE-FORMING TOOL.



By "Nene."

THE question of flange-forming tools has always been a live issue in railway shops where tires are turned, and particularly where old tires have to be re-turned. Where new work alone is done, the cut and material will, in most cases, have more or less uniformity. This condition does not exist, however, with repair work. The uneven wear of treads necessitates a very uneven depth of cut and, on account of "skidding," the hardness of the material is an exceedingly varying quantity.

This wide range of work conditions, coupled with the standardizing of the time allotted for each operation, requires a tool that is simple in construction, that will be strong enough to meet all conditions, and that can be economically maintained in good order. The writer has witnessed many attempts to fulfil these conditions, and has himself developed the tools herein described. This set of tools has been in constant use for the past six months, and has given the greatest satisfaction of any heretofore tried out.

The holder (H), shown in the figures, is forged from driving axle steel, and is planed to the dimensions given. The tools proper (T T) are made of Ultra Capital high-speed steel, and are ground to shape by hand on an ordinary grinder, in such a way that when the tool-holder is placed in the tool post with its side against the back of same, the tool is in the proper position to form the flange. The offset on the holder is to prevent it from slipping back through the tool post under pressure of the cut, and also aids in adjusting the amount that the tool projects from the holder. The time of setting the tool is thus reduced to a minimum. The hollow set screws are for clamping the tools together only. The tool post clamps bearing directly upon the tools (T T) render any other means of holding them unnecessary. The 7/8-in. set screws at the rear end are for adjusting the tools for repeated grindings.

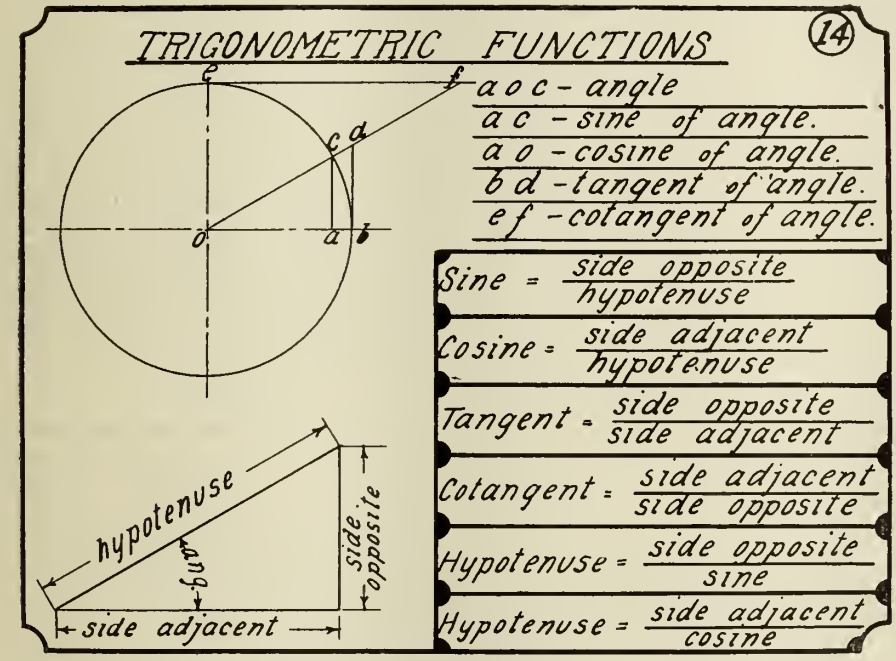
The practice has been to rough the flange off with the same round-nosed tool as is used in turning the tire tread, and then to finish the flange in one revolution with the formed tool. When the tools become too short to be effectively held by the tool post clamps, they are forged down to suit smaller lathes, and in this way eliminate any waste of expensive steel.

FLANGE-FORMING TOOL.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

Doubtless some of the elementary work in the first few articles of this series may appear more or less superfluous, but it must be remembered that numerous simple rules and formulae appear from time to time in Technical Journals, which are discarded and dubbed impractical by many operators for the simple reason that the elementals are either unknown or have been forgotten. The purpose of this course will have been achieved if the above tendency is even in part combatted.



TRIGONOMETRY.

MATHEMATICS which treats of the solution of triangles is called trigonometry.

Every triangle has six parts—three sides and three angles.

An angle, usually, is the opening between two radii of a circle, the circle being assumed as divided radially into 360 equal parts called degrees; each degree being again divided into 60 minutes, and each minute further divided into 60 seconds. It is evident that a 1° arc in two circles of different radii will be of different length, but will be proportional as the length of the radii. In trigonometry, the arcs of circles are used to measure angles.

In the solution of right triangles, the base (o b), Chart 14, is generally assumed to be in a horizontal position, the vertex (o) being in the centre of the circle, and the point (b), the starting point in measuring the angle. When adding two or more angles together, seconds are added to seconds, minutes to minutes and degrees to degrees.

ARITHMETIC CHART 14.

Trigonometric Functions.

A function of a quantity is another quantity which depends upon the first one for its value. The principal functions of trigonometry are the sine, cosine, tangent and cotangent.

The sine of an angle is the line (a c) drawn perpendicular to the base (o b), to the extreme end of the hypotenuse, when the hypotenuse is the radius of the circle.

The cosine of an angle is the distance (o a) from the foot of the sine to the centre of the circle or vertex of the angle.

The tangent of an angle is the line (b d) drawn perpendicular to the base to the extreme end of the hpyotenuse, when the base (o b) is the radius of the circle.

The line (e f), drawn from the extreme end of the vertical radius and parallel to the base (o b) to meet the hypotenuse or hypotenuse produced, is called the cotangent of the angle.

If the values of the various functions be known for any angle in a circle whose radius is one, their values for the same angle in any other circle can be obtained by multiplying their known values by the radius of the required circle. Conversely, if the value of any of the functions be known for an angle in a circle whose radius is other than one, the value for the same angle in a circle whose radius is one can be obtained by dividing the known values by the radius of the given circle. Chart 15 gives the values of the four principal functions, in even degrees.

ARITHMETIC CHART 15.

The values of 1° to 45° are given in a descending order, and those from 45° to 90° are found by reading from the bottom upwards. Approximate values of fractional degrees are found by the two formulas at the foot of the table.

PREVENTING STEAM BOILER ACCIDENTS.

THE following instructions for boiler operation and repair, taken from the book of rules issued by the Inland Steel Company, should prove of interest to all boiler owners and operators.

1—Two men should always work together when cleaning out boilers, it being the duty of one man to remain on the outside all the time and in a position to see the man working inside so as to give assistance in case it is needed.

2—Never go into a boiler until you have locked the steam valve and closed all other valves.

3—Before entering a boiler, put a torch or candle inside to determine the presence of gas or bad air.

4—In cutting a boiler in and out, use the non-return valves exclusively, in order to insure their proper working. Should the non-return valve fail to work in any instance, notify the foreman immediately.

5—The automatic valves should be examined sufficiently often to insure their prompt action in emergencies, such as the bursting of tubes.

6—When boilers are taken off for cleaning, the main stop valve in the steam connections should be shut off and dependence not put on the automatic quick-closing valves alone.

7—A sign, "Danger, do not move," should be hung on the steam valve of any boiler when it is shut down.

8—Never open a slide or valve when a danger sign is attached and until you have seen that no one is in the boiler.

9—Safety valves should be tested every shift.

10—When opening up any steam line take the following precautions:—(a) Open all available drips; (b) warm the line by opening the by-pass when possible, or by opening the stop valve sufficiently to warm it slowly; (c) never allow an inexperienced man to turn steam into a cold line, unless accompanied by the foreman.

SUN POWER PLANT AT CAIRO, EGYPT.

MR. FRANK SHUMAN, who is chiefly responsible for the design of the sun system of power production, gave in a recent paper before the Manchester Association of Engineers, particulars of the plant erected at Cairo, because that is the nearest place to the tropics easily accessible, though it is not the ideal position for a sun-power plant, being 30 deg. N. The equator would be the ideal position, but up to 20 deg. N. and 20 deg. S. sun power is considered quite satisfactory. In fact, it has been shown that even at Cairo profitable work can be done by sun-power plants.

The experience already gained has demonstrated that low-pressure steam used at atmospheric pressure gives the greatest return in power per dollar outlay. High-pressure steam could be generated by the sun's rays and higher engine efficiencies would result, but the gain would be more than nullified as, on account of the higher temperatures of the boilers, the losses by conduction and convection into the atmosphere would increase. Then, there would be the additional expense of constructing high-pressure boilers.

General Arrangement.

At Cairo, the steam is generated in improved forms of sun-heat absorbers, of which there are five, each 13 ft. 4 in. wide at the top and 204 ft. long. They are approximate parabolic troughs for catching the sun's rays and concentrating them upon the boiler swung at the focal point. These heat absorbers—five in number—are placed about 25 ft. apart in the clear, so that they will not shade each other when the sun is low in the morning and late afternoon. Their axis point north and south and they turn from east to west on their axes to face the sun. The mirrors are set in a light steel frame, each one at the proper angle to throw the sun's rays upon the boiler, and consist of ordinary sheets of third quality window glass 1-16 in. thick, silvered on one side, the silvering being protected from the atmosphere. At the focal point of all the light rays, there hangs a cast iron boiler, which is tubular at the top and flat at the bottom where is located the water space.

This boiler is 15 in. high and is hung on light rods in such manner that expansion and contraction will not affect it. The heat absorbers are a distinct advance upon those in use at Philadelphia. They are set on crescent-shaped frames, which roll on a system of small rollers, while racks and pinions are provided for turning the absorbers from a low eastern aspect in the morning to a low western aspect in the evening, the necessary power being provided by the steam engine and friction clutch, an adaptation of the thermostat being used to throw the clutch in and out of gear. The thermostat is placed immediately below the boiler and remains in the shade as long as the absorber points correctly to the sun. When the sun moves ahead a little and the sunlight strikes the thermostat, the clutch is engaged, and the absorber is turned westward accordingly. When the thermostat is shaded again, the clutch is released and the absorbers stand still, and so on.

The Engine Feature.

The engine is of special design to utilize low-pressure steam to the best advantage, and, according to the author, is extremely efficient, giving one brake horse-power per 22 lb. of steam at atmospheric pressure. It has cylinders 36 in. by 36 in., and gives its power at 110 revolutions per minute. The pump is of the reciprocating type, and a small petrol engine is provided for creating a vacuum in the condenser for starting. At Cairo, the plant commences to make steam at about 7.30 a.m. in midsummer, and the maximum is reached between ten and two o'clock. Then the amount gradually decreases until 5.30 p.m. Tests made show that the average production is 1,100 lb. of steam at 15 lb. absolute pressure per hour for a ten-hours' day. In other words, the plant at Cairo is capable of giving an average of 50 brake horse-power.

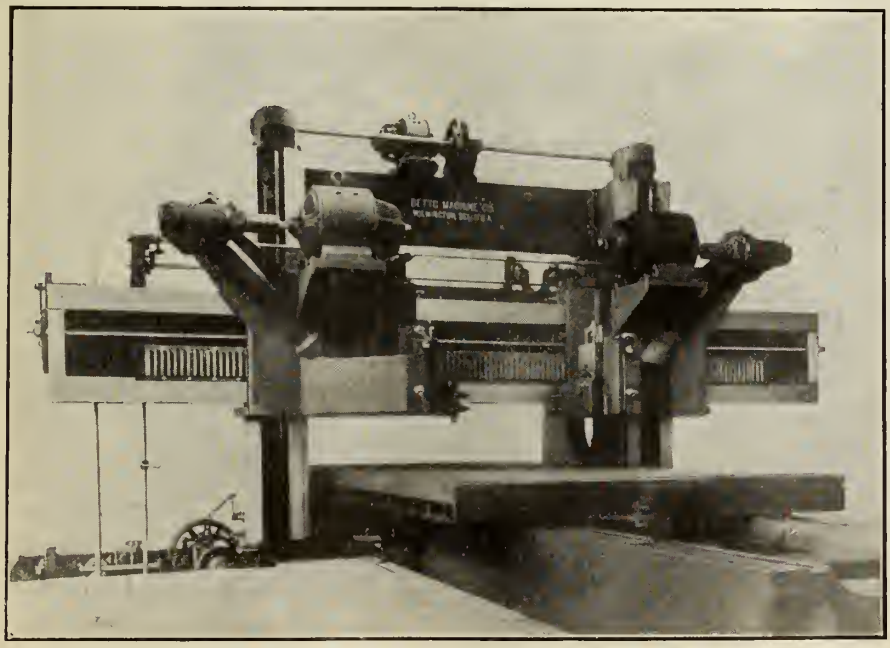
The boilers of the present plant are surrounded by a single thickness of window glass in order to minimize the loss by conduction and convection, but in future plants the glass will be dispensed with and the number of concentrators of sunlight increased from five to ten. All the mirrors used in constructing these heat absorbers are held in place by means of small brass springs, to give flexibility and prevent breakage due to expansion and contraction, while a certain amount of resiliency is provided against hailstorms.

Test Data.

As regards the comparative costs of sun-power and coal-burning steam plants, Mr. Shuman said that the steam-producing part of this plant will cost, erected in the tropics, the sum of $7,800, being at the rate of $155 per brake horse power. The boiler, stack, and buildings of a coal-burning plant to generate the same amount of power for ten hours per day throughout the year are estimated to cost $3,850.

According to comparisons made, the sun-power steam generator will compete in the tropics with a coal-burning steam generating plant which can obtain its coal at only $2.50 per ton delivered to the furnace doors. Any excess in the cost of coal burned beyond this figure is clear profit in favor of the sun-power plant, and as the cost of coal in the more favorable places in the tropics where sun-power plants will be built for the present may be taken at no less than $15 per ton, the saving would be some $2,050 per annum, with 365 working days of 10 hours each.

The heat absorbers of the Philadelphia plant had a thermal efficiency of 43 per cent., whereas those in the Cairo plant have an efficiency of 57 per cent., or, in other words, out of every hundred heat units which reach the absorbers, 57 per cent. are turned into steam and used in the engine.



DEVELOPMENTS IN MACHINERY

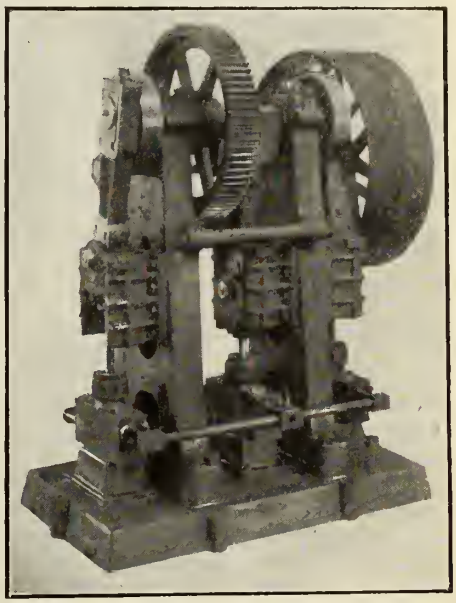
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

SPECIAL PLANER OF INTERESTING DESIGN.

THE rather curious looking planer shown in the illustration was built by the Betts Machine Co., Wilmington, Del., for the Commonwealth Steel Co., Granite City, Ill., after the latter company's special design; its purpose being to machine the ends of castings running up to 30 feet in length, a proceeding that is impossible with the ordinary type of planer. The cutting tools are arranged so as to move at right angles to the platen, which permits machining the ends of castings of any length as well as other surfaces which cannot be reached with the ordinary planer.

The machine consists essentially of a 10 x 7 x 18 ft. planer of standard construction. The cross rail is, however, special and carries two cutting heads, each of which is driven by a 30 h.p. Westinghouse Electric & Mfg. Co. reversing planer-motor. The two motors are connected together electrically so that if one reaches the end of a stroke before the other, it automatically stops and waits for the other to furnish its stroke, when they both reverse together. To obviate the danger of the heads running together, a push-rod is mounted on one which opens the circuit and stops the motors if pressed.

SPECIAL PLANER OF INTERESTING DESIGN.



The heads are designed for a cutting speed of 30 ft. per minute, and a return speed of 75 ft. per minute, and are guaranteed to take two ½ x ⅛ inch cuts simultaneously in cast steel.

The platen is provided with a power rapid traverse of 20 ft. per minute as well as a power feed. It is driven by a 7½ h.p. motor of Westinghouse Electric & Mfg. Co. make, while the cross rail is raised and lowered by a similar motor.

VERTICAL TRIPLEX HYDRAULIC PUMPS.

THE accompanying illustration shows a new vertical type of single acting, triplex hydraulic pump as designed and built by the Hydraulic Press Mfg. Co., Mt. Gilead, Ohio. This type of pump is made in three runs of sizes. The J pump has a stroke of 8 ins. and is equipped with plungers ⅞ in. to 3¼ in. in diameter. The JJ pump has a stroke of 12 in. and has plungers 1 in. to 4½ in. in diameter. The JJJ pump has a stroke of 12 in. and has plungers 1¼ to 5 in. in diameter. The range of pressure capacity is from 600 pounds to 16,000 pounds per square inch, depending on the size of the piston. These pumps are driven by either belt or electric motor, the J size requiring 25 h.p. to operate; the JJ 50 h.p.; and the JJJ, 100 h.p. The effective speed of each of three pistons is 33 1-3 ft. per minute for the J pump, and 45 ft. for the JJ and JJJ.

The pumps are fitted with screw glands working against followers when equipped for high-pressure work, or with stud glands when equipped with large pistons for low-pressure work. The pistons are packed with compression packing. Forged steel is used in the con-

VERTICAL TRIPLEX HYDRAULIC PUMP.

struction of the high-pressure pump cylinders and crank shafts. The crossheads are guided and fitted with cast-iron adjusting screws which are bored to provide a perfect guide. The connecting rods are made of open hearth cast steel, and have bronze bearings with wedge and screw adjustment at both ends.

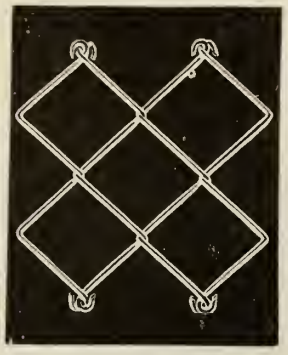
When this pump is operated by a belt, it has a single reduction of gears for the J size, and a double reduction for the JJ and JJJ sizes. The pulleys can be arranged to drive from either end. When a motor is used to operate, it has a double reduction of gears for all sizes. The first reduction has a ratio of 5 to 1, while the second reduction depends on the speed of the motor used. The height of the J pump is 5 ft. 9 in.; the JJ, 8 ft. 1½ in., and the JJJ, 8 ft. 10 in.

A NEW EUROPEAN WIRE FENCE MACHINE.

IN view of the increasing demand for wire fencing in this country, a description of a new wire netting fence machine built by Otto Schmid, Feuerbach-Stuttgart, Germany, is not unseasonable. One of the chief advantages

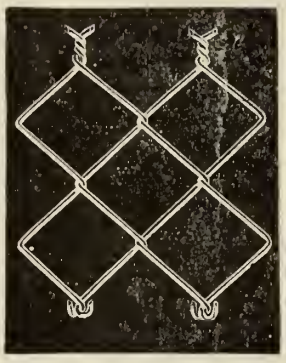
claimed for this machine is that it handles galvanized wire successfully and thus eliminates the necessity of a galvanizing plant to finish the product. Simplicity of design and operation and the comparative lack of skilled help required for operation are also strong points set forth in its favor.

The machine occupies a floor space of about 16 ft. 6 ins., by 9 ft., and is about 5 ft. high over all. It can be set with the aid of certain attachments to produce meshes of various sizes from 1¼ in. to 4 ins. square, and the rate of production per ten-hour day is from 3,300 to 4,400 sq. ft. for the smallest mesh and from 7,800 to 8,900 sq. ft. for netting of 4 in. mesh, according to the gauge of the wire employed. The width of the piece can be made to range from 2 ft. 8 ins. to 6 ft. 6 ins., and the wire is the ordinary mild steel wire of commerce and, as before stated, is already galvanized.



The netting is made complete with edges in one operation. The wire to form the meshes is drawn from a wire swift placed on the floor, while the wire to finish the edges is drawn from two swifts, one placed at each end of the machine. The machine may be arranged to produce edges of four different kinds, viz.:

(1) With the ends of the wires which form the meshes bent over on both edges.



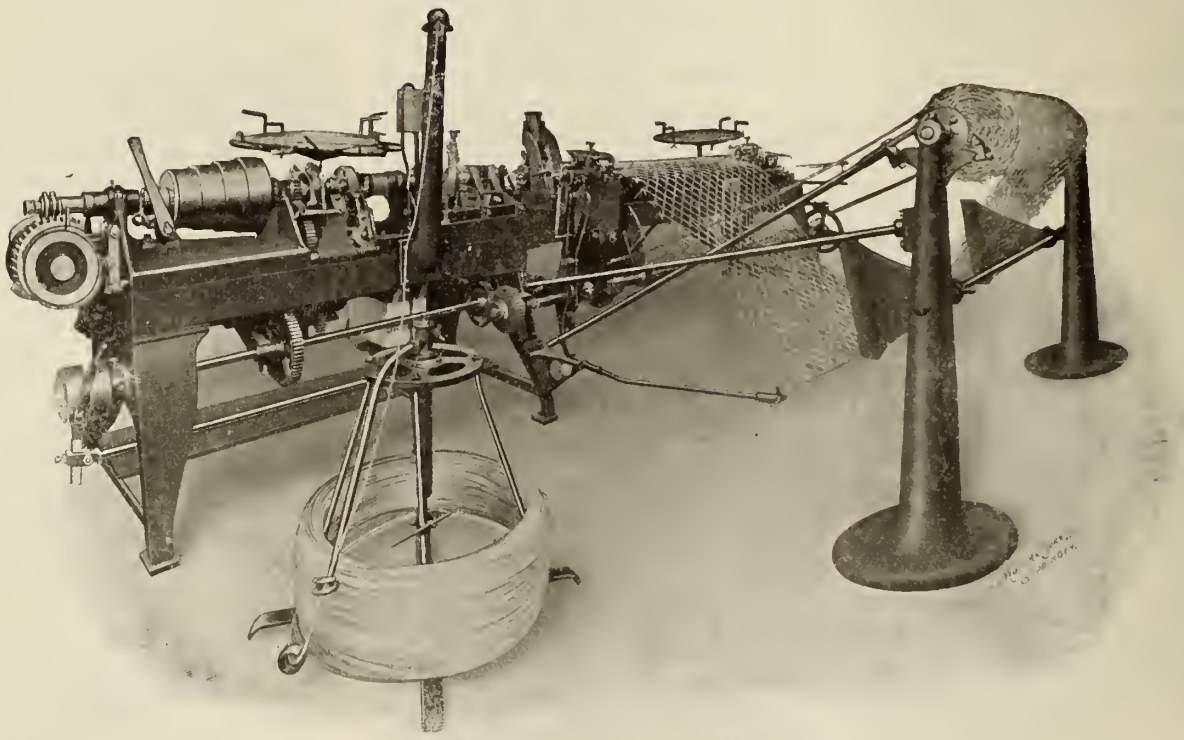
(2) With barbs twisted on the upper edge and the wires bent over on the bottom edge.

(3) With plain or two stranded edging wires on both edges of the netting and the ends of the mesh wires bent over plain.

(4) With edging wires in both edges and the mesh wires twisted into barbs on one edge and twisted over plain on the other. These different styles of finish at the edges are produced automatically and simultaneously with the making of the meshes, and as the netting is completed, it is wound up into rolls of convenient size.

Bent over on both sides.

Barbs twisted on top, wires bent over below.

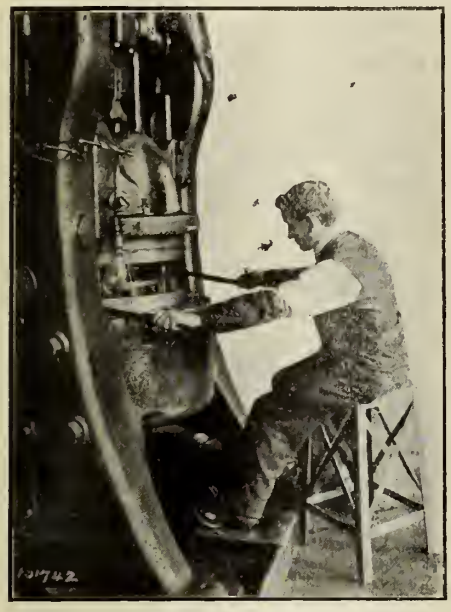


Both sides with tension or edge wires.

One side with tension or edge wire, the other with edge wire and barbs.

EXAMPLES OF NETTING—1½ IN. TO 4 IN. MESH, WIRE GAUGE 2-32 IN. TO 5-32 IN.

The power required to operate is derived from a two-h.p. electric motor, and the machine is automatic to such an extent that one man can easily operate two machines. The fencing is produced without undue strain being placed on the wires so that the netting is suited for concrete reinforcement and other uses as well as for fencing.



AUTOMATIC WIRE NETTING MACHINE.

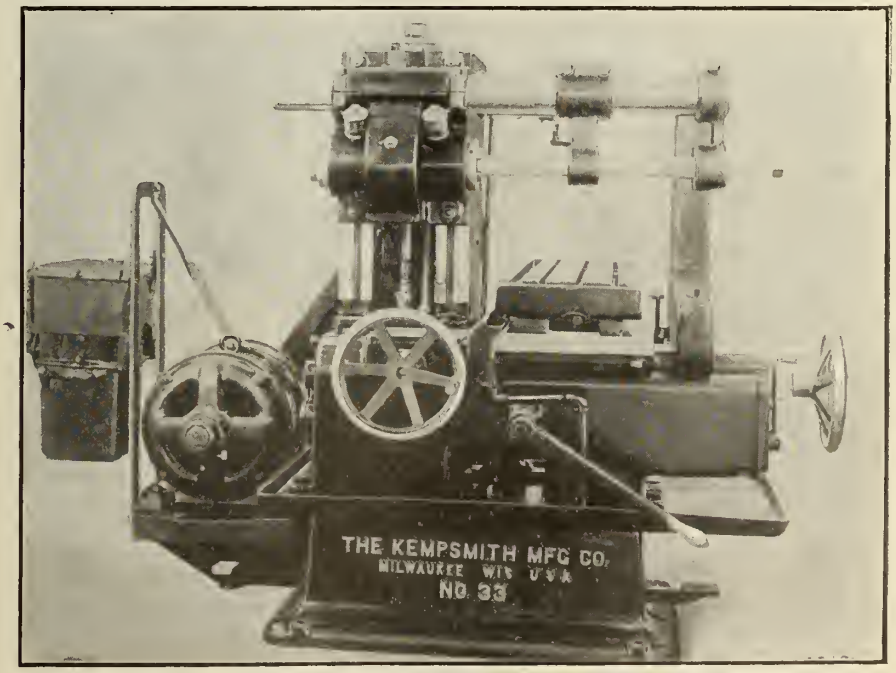
Edward Brand & Co., 96 Victoria street, Westminster, London, S.W., Eng. are colonial agents and distributers for the above described machine.

SAFETY SUCTION DEVICE FOR PUNCH PRESSES.

FOR some time the Westinghouse Electric & Mfg. Co., at East Pittsburg, tried mechanical safety devices of various kinds for the punch shop but with unsatisfactory results. The operators found them unsuited because of the fact that they tended to retard the production and consequently their earnings, while the management also objected to them because they afforded only partial protection, as the operator had to place his hand under the press in every instance, in order to remove the scrap. The suction device illustrated herewith was developed with the idea of preventing the necessity of the operator approaching the danger point at any time during the operation, as he feeds and clears the press with the same tool.

SAFETY SUCTION DEVICE FOR PUNCH PRESSES.

Another advantageous point is that the operator does not take hold of the material with his hands (this applies principally to the smaller sizes), and thereby escapes the numerous small cuts to which he was subjected when inserting the blanks with his fingers. The double-handle device used on large work and shown in the illustration is absolutely safe, the operator being compelled to use the device owing to the size of the sheets handled, it being impossible to get hold of them any other way. Before adopting this method, a man was placed at the back of the press to feed in the sheets, and he was the man who most frequently was injured because his fingers were entirely at the mercy of the operator.



Since the adoption of the suction device, there has not been an amputation on the large presses and up to the present time no finger has been amputated in the punch shop. This freedom has been due to the operation of the device and the rigid enforcement of the rules by the management of the shop.

The suction device was exhibited and received the grand prize at the recent International Exposition of Safety and Sanitation in New York City, and is now on exhibition in the American Museum of Safety in New York City. The Westinghouse Electric & Mfg. Co. also employ a number of other safety appliances such as magnetic lifters, sliding devices, etc., adapted for the different kinds of punchings made.

MULTI-SPEED MILLING MACHINE FOR CONSTANT SPEED MOTOR DRIVE.

THE milling machine illustrated herewith, which is the product of the Kempsmith Mfg. Co., Milwaukee, Wis., is designed to give a number of spindle speeds with constant speed motor drive and hence is admirably adapted for use with squirrel-cage alternating-current motors. A range of spindle speeds from 25 to 120 r.p.m., is provided, with a different gear ratio, ranging from 2½; 1, to 11½; 1, for each speed. The machine can, therefore, take the stiffest cuts with higher speed cutters. All speed changes are effected through change and sliding gears; there being no loose gears.

The machine is massively constructed throughout and is adapted for heavy manufacturing service. Every lever and wheel is located within the operator's reach so that very rapid production is possible. The longitudinal table feed is 36 inches; the vertical adjustment of the spindle, 10 inches; the working surface of the table, 42 by 13 inches, and the total distance between housings, 26¾ inches. Power is supplied by a Westinghouse Electric & Mfg. Co. alternating current squirrel-cage motor.

MULTI-SPEED MILLING MACHINE FOR CONSTANT SPEED MOTOR DRIVE.

CANADIAN PATENTS.

PIGEON, PIGEON & DAVIS, patent solicitors, St. James Street, Montreal, report that 136 patents were issued in Canada on March 24, 1914. Of these patents 87 were issued to residents of the United States, 29 to Canadians and the balance to residents of foreign countries. The following is a partial list of the patents granted to Canadians:

A. K. Mitchell, Victoria, B.C., Flue Joints.

J. P. Linton, Montreal, Que., Mail Chutes.

J. E. Bennett, Toronto, Ont., Furnaces.

R. W. Burnett, Montreal, Que., Dump Car Doors.

X. Longtin, St. Johns, Que., Air Valves.

J. Rundgren, Vancouver, B.C., Fish Plates.

H. P. Borden, Montreal, Que., Bridge Construction.

W. R. F. Patchett and H. Pilling, Lethbridge, Alta., Internal Combustion Engines.

P. Barton, Calgary, Alta., Hose Coupling.

A. Buie, Calgary, Alta., Water Power Apparatus.

W. S. Dignam, Toronto, Ont., Vacuum Washers.

FACTORY ACT AMENDMENT.

AN amendment to the Factory Act in the Province of Ontario seeks to include men who operate hoisting engines within the scope of the requirement of a stationary engineer's operating license. The term "hoisting engines" is rather vague and seems to imply a complete absence of both knowledge and purpose on the part of those responsible for this projected addition to the statutes. Hoisting engines embrace a particularly wide field, some sections of which are on a par with many of our power plant units, and are no doubt considered, at least, as such by their owners in the matter of licensed competency.

We presume, however, that it is now sought to include, crane equipment, steam shovels, concrete mixers, etc. If this be the case, a levelling down process so far as the operative is concerned appears to be the result, and unless some concurrent legislation which will discriminate between man and man, and reward higher intelligence and capacity attainment, we fear that little real benefit to anybody will ensue from the present action.

THE VALUE OF A FOREMAN.

UPON a recent visit to the machine shop of a well-known firm, we were required to wait a considerable time for the foreman. When, at last he appeared, it was with a twenty-pound casting in one hand and the other one too grimy to offer his visitors. After wiping off the perspiration it was necessary for us to spend twenty minutes seeking the information desired of him, and which, when obtained, was more or less unsatisfactory.

A foreman, in the eyes of the veriest layman, is a man who has proved his efficiency in skilled and unskilled labor to such an extent as to be a suitable person to act as a director of his apportioned work. If this directing be thoroughly and properly done, the foreman, no matter how active he may be, will have little time to devote to the work of his subordinates.

It is an extremely thoughtless and short-sighted policy of a management to load a first-class mechanic and disciplinarian, as the foreman should be with a quantity of clerical and laborious work. There are many foremen who are required to spend one half of their time at the tasks of cost clerks, draughtsmen and even errand boys. In the great majority of cases, however, this condition is brought about by the carelessness of the foreman himself. There are, of course, many instances where it is less trouble to do a job oneself than to explain its ins and outs to others, but this is often due to the fact that the foreman is not practised in doing the latter.

The cost of a mechanic is considerably less than that of his foreman; that of a clerk should be about one-half, and that of a boy about one sixth. If he does the work usually allotted to any or all of these classes of men, particularly if it be to the slightest disadvantage of his own work, the manager is inclined in nearly every case to place him in a lower class and remunerate him accordingly.

A period of vigorous self-government upon his own part in adhering to the policy of delegating these tasks to the proper persons will cause the foreman to find a wonderfully large number of other ways in which he can be useful to his firm. He can study the temperament of each man and govern him accordingly. He will find that he can think of several things at once and that his forethought will make unnecessary many of the fatiguing tasks which he previously allotted to himself. He will be prepared for emergencies which, though they do not come often, if taken by the forelock can be turned to great benefit to the institution. A physically tired man has not the nerve force necessary to govern workmen to the best advantage or to retain their greatest respect. The admiration of a man is seldom gained by doing something that he can do just as well himself, or something that he considers beneath his own dignity. The reformed foreman will find it much to his advantage to cultivate those attributes which he considers essential to the men above him. Keen perception of possible economies, promptness in dealing with exigencies, firmness and fairness in discipline, and alertness in dealing with the manager himself are much more likely to favorably impress that official than a personal exhibition of mechanical ability.

INDUSTRIAL NOTABILITIES--No. 31

BERNARD WILLIAM PALIN COGHLIN, president of B. J. Coghlin Co., Ltd., was born February 10, 1874, at Montreal, Que. He is a son of Bernard James Coghlin, of Irish birth, a prominent manufacturer, and Lucy Alice Palin Coghlin, who was of English birth.

B. W. P. Coghlin was educated in the public schools of Montreal, and in 1891 commenced his business career, entering his father's employ as clerk and working his way up in the various branches of the business, learning it in all its details.

In 1905 he was admitted to the firm as partner, and upon the death of his father, in 1909, he turned the business into a limited liability corporation under the firm name of B. J. Coghlin Company, Ltd., manufacturers of railway sup-

BERNARD W. P. COGHLIN.

plies, etc., with an extensive manufacturing plant at Montreal. Mr. Coghlin is president and managing director.

He is a member of the Montreal Club, Montreal Jockey Club, Montreal Amateur Athletic Association, Montreal Curling Club, Outremont Golf Club, Kanawaki Golf Club, the Winter Club, Canadian Club, Montreal Board of Trade, Canadian Manufacturers' Association, Montreal Art Association, and is a Governor of the Montreal General Hospital.

Mr. Coghlin was married October 28, 1903, to Louise Jean Dawes, daughter of the late James P. Dawes.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

OUTLOOK STILL TOWARDS DULLNESS.

RECENT events have not been at all reassuring as far as the business outlook is concerned. Weakness in the shares of steel companies can only be interpreted as indicative of further industrial dullness. The favorable tariff changes were not sufficient to offset price declines, and the lack of a decision relative to the C.N.R. aid accentuates and encourages the prevailing pessimistic tendency. Not until that is finally disposed of will business settle down to a more normal basis. Meanwhile the ordinary business of the country seems to be moving along at a pace considerably under that of a year ago. Some acceleration has been felt as the result of spring weather and spring conditions.

Some Hopeful Signs.

It may be as well to note here that our principal cities are looking forward to development of an exceptional character during the coming summer. At Toronto the harbor improvement and new railway terminus will be proceeded with; at Montreal the railways are under the necessity of incurring immediately expenditures on a large scale; and at Winnipeg a big scheme to provide the city with a supply of soft water will be under way, and building there has already assumed proportions quite as large as those of the previous year. Up to the 10th of April the building permits were $700,000 greater than for the previous year. At Vancouver the several railroad corporations with terminals there will during the coming year carry on work which will cause much money to be circulated in that city. At other important cities, both in Eastern and Western Canada, there will be expenditures which may be reasonably termed somewhat exceptional. For the carrying out of the contemplated improvements the financing has to a very large extent been done. Our cities therefore have not any reason to look upon the coming summer months with any degree of gloom. In so far as the agricultural classes are concerned, they are still enjoying very high prices for their products, that is, those who have given attention to mixed farming. Seeding operations have already started, and the next few weeks will be watched with keen interest as they have in them a very important factor in shaping the trend of business. The temperature in the West has been steadily improving as indicated by official returns.

Wage Reductions Probable.

It is quite probable that within the next few months there will be a re-adjustment of wage schedules in Canada. Already the steel men in the United States are considering taking some action in this respect. It is quite apparent that capital for the next year or so will have its innings. It will not be in the position of having to pay high wages for necessary labor in order to get it, but will be in a position to bargain.

Montreal, Que., April 20, 1914.—The general opinion indicates a slight improvement in most lines during the past week, though the metal market remains quiet. Machinery brokers in particular report an improved state of affairs, which is the more gratifying, as nobody has been worse hit than they by the hard times we have been passing through. Two important machinery orders have just been placed. One of these is for the equipment in connection with the Prince Rupert dry dock of the G. T. P. Railway. This is the most valuable contract placed during the past six months, and amounted to over $100,000. The whole of this large order is understood to have been divided between the John Bertram & Sons, Co. and the Niles-Bement-Pond Co. It is satisfactory to know that this matter has now been settled, it having hung fire for some considerable time; in fact, tenders were submitted in December last.

The other contract referred to as being placed this week is that for the machinery to be installed in the new Longueuil plant of Armstrong, Whitworth of Canada, Ltd. This order has been split up amongst the leading Montreal dealers, Williams & Wilson and the Canadian Fairbanks-Morse Co. getting a good share of the business.

It is interesting to note that some pretty good judges of financial conditions are expressing the opinion that the stock market has fallen about as low as it will do, and that better times may shortly be expected. Other well-known business men, on the other hand, see little prospect of a resumption of normal conditions before next fall. The dull state of the building trade during the past nine months is reflected in the annual report of the National Brick Company for the year ending February 28, 1914. This shows a striking decline both in gross and net earnings, the latter marking a reduction of more than 46 per cent., as compared with the previous twelve months.

Toronto, Ont., April 21, 1914.—The business outlook cannot be said to be any more favorable than was reported last week. While the tariff changes will eventually have a favorable effect upon the operations of the steel companies, it is too early to expect any definite improvement as this will only become pronounced when the money market becomes easier and the demand for material correspondingly greater. The trouble between the United States and Mexico, as was to be expected, has had the effect of depressing the money market, although it has been to some extent already discounted. The effect, however, will be sufficiently great to postpone, until a settlement is finally reached, any permanent improvement. The railroad situation remains the same, no decision relative to the C.N.R. having, as yet, been handed down by the Dominion Government. It is reasonable to suppose that when the matter is settled and if favorable, as is generally expected,

that it will mean the purchase of a large amount of material for improvements, extensions and equipment. The Canadian Kodak Co., have called tenders for their new reinforced concrete factory at Mount Dennis, Ont., but no awards have been made up to the present.

The outlook in the steel industry does not improve, and it is difficult to say when a reaction will take place. Prices on structural shapes are being maintained and it is thought that there will not be any reduction. The demand has not increased to any appreciable extent, as might reasonably have been expected with the return of more favorable weather conditions for building operations. An improvement in this respect should be in evidence in the near future, although no large buildings requiring steel are apparently being projected. The steel companies in the United States are operating at considerably reduced capacity, and the question of reducing wages is still being discussed. Some mills are running on short time.

No change can be reported in the pig iron market, a condition of dullness with firmer prices still continuing. Shipments are generally in light tannages, consumers only buying to cover immediate requirements.

The machine tool business, although quiet, seems to be looking brighter. Local dealers report a larger volume of inquiries of a more substantial nature than during the past few weeks. Orders are, as a rule, only being booked for single machines, buyers apparently waiting for a return of good trade before preparing larger specifications.

The metal market is, if anything, rather brighter, and prices keep firm. Buyers appear to still be in a cautious mood, and consequently the volume of business being done is not large, although conditions are improving gradually.

Ottawa, Ont., April 20, 1914.—Tenders were called during the past week for the new Government-owned interior storage elevator at Calgary. The new elevator will have a capacity of two and a half million bushels, and the estimated cost runs from one to one and a half million dollars. Plans and specifications of the new elevator can be secured from the chief engineer of the grain commission, whose office at present is in Saskatoon. The new elevator will be modeled after those now at Moose Jaw and Saskatoon. Tenders are to be in by June 1.

Engineer Howe of the Grain Commission who has over-sight of the construction of the new elevators was in Ottawa during the week consulting with the Government in regard to the new Calgary elevator. He states that splendid progress is being made on both the Saskatchewan elevators and that they will be ready for operation by December 1, which is the time when they become useful from a transportation standpoint.

An exceptionally large Government contract was let by the Cabinet on Saturday, being that for the construction of a big jetty wall nearly four miles in length at the mouth of the Fraser River, and for the necessary dredging to make a channel three hundred feet wide and ten feet deep at low water. The successful tenderer was the Pacific Dredging Co., their price being $755,993.

The end of the session at Ottawa is in sight now and another week will see the beginning of morning sessions. The only important measures left as far as the business world is concerned are the Trust and Loan Companies Act and the New Consolidated Railway Act. The Trust and Loan Company Acts have already been pretty well threshed out by the banking and commerce committee and are ready for the House. The discussion in the House should not be long.

As for the Railway Act, the railway companies, it is understood, are making preparations to make vigorous objections to certain sections, particularly to those clauses which place the complete control of capitalization in the hands of the Railway Commission. In fact, they generally object to the increase in the power given the Railway Board. One high railway official complained that the railway presidents were only messenger boys for the Railway Board.

From the standpoint of shippers, one of the most important features is the proposed changes in the law which will place the control of all water freight rates as well as railway rates under the control of the Commission.

Winnipeg, Man., April 18, 1914.—While building permits in the city of Winnipeg have passed the four million dollar mark, and the figure is going up at an unprecedented rate, business all round does not show the improvement one would expect. There is considerable talk of what the railways will do, but so far few contracts have been awarded. Yesterday, the contract for the Weyburn-Lethbridge route on the C.P.R. was awarded, which will mean business further West, and the impression is that if any railway work be done this year, it will be much farther West than Winnipeg.

In the machine tool market, a cloud seems to have fallen again, and the inquiries from machine shops of a month ago have ceased somewhat. At Transcona, Man., where the G.T.P. shops are located, things are beginning to hum. They have 1,200 men working altogether in the repair and car shops, and repairs to engines, cars and coaches are keeping them very busy. They have recently installed a considerable quantity of machinery in the new car repair shops, the departments of which consist of woodworking, car wheel repair, and painting departments. While they are not manufacturing new cars, it is understood that they now have the facilities for so doing as soon as conditions warrant it.

An important industry is about to open up at Selkirk, Man., in the Manitoba Rolling Mills, and our information is that they will probably be ready for operation some time next month. They are located about a mile and a half south of the town of Selkirk.

A large amount of engineering work is being done on grain elevators throughout the West, which keeps firms like the Vulcan Iron Works and the Manitoba Bridge & Iron Works fairly busy. Lumber firms, several of whom were reported to be contemplating erecting new mills throughout the West, are reported to be waiting until business improves appreciably. Contractors are not buying.

The St. Boniface and Motor Co. Ltd., were incorporated here last week with $75,000 capital, and should be erecting a garage and machine shop. Development work has started on the new Winnipeg power plant on the Winnipeg River at Grand Bonnet Falls. The engineers, J. G. White & Co., New York, are figuring on three alternative plans for building the dam and plant

---

THE WESTERN FREIGHT RATES JUDGMENT.

THERE has been and still is some controversy as to the effect of the decision on earnings. That these will show a considerable falling off is only to be expected, "but," says one authority, "it may be doubted if any decline in the stock is actually justifiable, nevertheless."

This statement is made in view of the fact that, although the commission granted a reduction in freight rates in the West, a deaf ear was turned to the main contention of the West that the lower rates in the East constituted a discrimination against the West. The commission declared that this was not the case. It supported the railways in the main contention, but it ordered rate decreases, especially in Saskatchewan and Alberta.

"The rates in these Provinces were ordered to be pulled down to a level of those of Manitoba. Other reductions, also, were ordered.

Reduction Coming Anyway.

"It is hinted in some quarters, however, that it was only a matter of time until these rates would have had to come down anyway. In fact, some declare that the C.P.R. would voluntarily have reduced the rates very shortly, as soon as the C.N.R. and the G.T.P. became full-

fledged transcontinental railways entering fully into competition with it. Assuming that this were the case, the railways actually lose nothing worth speaking of as a result of the decision of the commission.

"On the other hand they have gained much, as they are no longer threatened with the possibility of having to pull down their Western rates to a level of the East. Moreover, it seems likely that it will be a long time before they will again be subjected to such a gruelling as they were in the recent investigation. A principle in railway rate-making has now been established that will make for the stability which is so much desired by the commercial world."

Benefit of Through Freight.

Incidentally, it may be interesting to quote from the decisions of the Railway Board their comment on the effect of the construction and operation of the Canadian Northern and the Grand Trunk Pacific upon the earnings of the Canadian Pacific:

"Perhaps the main reason why the results of the Canadian Pacific are so much more favorable than the returns of the Canadian Northern and of the Grand Trunk Pacific is that the Canadian Pacific gets the benefit of through freight both east and west of the Prairie Provinces. That company enjoys the through haul not only of its own business, but also on the business of the other systems in so far as their through business is carried in Canada. The Grand Trunk hopes to have its through connections some time during the present year, while the Canadian Northern should finish the construction of its main line certainly some time the year after.

"The railway situation would then be entirely changed. The monopolistic advantages of the Canadian Pacific will disappear. The through business to a greater or less extent, will be divided among the three lines. There will be three sets of overhead expenses to which the through traffic will be subject, and it is very doubtful that the natural increase of the country's business will recoup the Canadian Pacific, at least for some time, for the losses of business that line will experience not only by the completion of the other two systems, but in view of the fact that the Canadian Pacific has, during the period under observation, earned large sums of money in respect of traffic which must entirely cease; that is, the revenue that it has obtained in handling the materials, supplies, and men that the building of the other two lines has required."

MAY HASTEN CONSTRUCTION OF STEEL PLANT.

THERE is every reason to believe that one effect of the action of the Canadian Government in putting a tariff of $3.50 a ton on wire rods, will be to cause the management of the United States Steel Corporation to hasten the construction of the company's proposed new plant at Ojibway, Canada.

The corporation is a large exporter of wire rods to the Dominion and the tariff will of course, militate against it, although a considerable portion of the rods sent to Canada are of special specification which the mills in the Dominion are not able to supply, and it may be presumed that even with the tariff handicap the Corporation will still be able to get orders for these.

The site for the new plant has already been laid out and in view of the tariff development, it is understood that the Corporation will carry out its original intention to break ground for the actual work of building this spring.

STEEL OUTLOOK DEPRESSING.

MUCH pessimism appears to be current regarding the Canadian steel industry and the earnings of the Canadian steel companies, and the stocks of the various Canadian corporations are all lower. This state of affairs appears to be a replica of the situation in the United States, where the Steel Trust shares have been under pressure, where low prices for steel are quoted, and where very dismal estimates of earnings are current. The fact seems to be that on both sides of the line there is a scarcity of orders for steel products.

Building operations are not anything like as active this year as they were last spring, and the steel mills, the cement companies, and similar concerns, which supply building material of various kinds, are suffering. Only a short time ago the Canadian steel stocks were quite buoyant in expectation of the tariff concessions, which they expected. They secured the concessions but the buoyancy is all gone. No amount of protection, it would seem, is of avail unless customers are willing to buy.

HANDLING EIFFCIENCY.

THE general adoption of overhead runways in the foundry has been considerably retarded by the use in many instances of unsuitable, or only partly suitable equipment. There is being marketed a traveling chain-block which is specially designed for handling molten metal, a particularly interesting feature being the arrangement by which the hand-chain is carried away from the ladle so as to keep it cool, and at the same time prevent it from accidentally falling into the hot metal. It may be noted too that the lifting gear is built up into the trolley. This makes a very rigid construction, gives a high lift and tends to keep the gearing away from the heat. The traveling wheels are fitted with ball-bearings to permit of a high speed of operation, and this is also aided by the construction of the junctions which, containing no moving parts, require no time to operate them.

The Herbert Morris Crane & Hoist Co., Toronto, have put the above equipment on the market.

Trade Gossip

Victoria, B.C.—The contract for the 84-horse-power motor hose wagon to be secured for the fire department will be awarded to the Nott Fire Engine Co. of Minneapolis, at a figure of $7,000. The apparatus will be of the six-cylinder combination type. The Canadian Consolidated Rubber Co. will supply 1,500 feet of 2½ in. fire hose at $1.10 per foot, and an equal quantity will be purchased from the Gutta Percha & Rubber Co., at a similar figure.

Victoria, B.C.—The contract for the construction of the steel riveted pressure pipe line for the Sooke water works system, to connect the Humpback reservoir, was awarded on April 6, by the city council to the Burrard Engineering Co. of Vancouver. The price was $324,000. This bid was the lowest of six recently received. The other bidders were Hutchinson Bros., of Victoria, $342,000; F. V. Robertson, $365,750; Moore & Pethick, $380,000; Victoria Machinery Co., $384,036; Canadian Northwest Steel Co., $423,250. Offset against this price is steel plate to the value of $157,000, now in possession of the city. This is paid for, and must be used by the contractor.

The General Supply Co., Winnipeg, have secured the agency in Manitoba and Saskatchewan for the Cincinnati Milling Machine Co., and the Cincinnati Bickford Machine Tool Co., Cincinnati. They have also been appointed agents of the Bradford Machine Tool Co., Cincinnati, for the whole of Canada. Other agencies secured are:—G. W. Parsons, Newton, Iowa, makers of the Parsons trench excavating machinery, and that of the Foos Gas Engine Co., Springfield, Ill. Already orders for 25 of the latter firm's 12 h.p. engines have been secured for service in Saskatchewan elevators around Regina. The above company has also the Western agency for the Smart Turner Machine Co., Hamilton, Ont., makers of steam pumps.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Toronto, Ont.—The Canada Metal Co. will build an addition to their factory.

Lucknow, Ont.—The Imperial Bag Holder & Machine Co. will extend their machine shop and install new equipment.

Montreal, Que.—The Simonds Canada Saw Co. will build an extension to their factory. C. E. Deakin, Ltd., has secured the contract.

Edmonton, Alta.—The City Commissioners have decided to build a pumping station at South Edmonton at an estimated cost of $50,000.

Medicine Hat, Alta.—George Sillman is establishing a factory at Dunmore for the manufacture of steel bins. The factory will open in a few days.

Saskatoon, Sask.—Fire destroyed the premises of the John East Foundry Co. recently. The loss is estimated at $5,000, which is covered by insurance.

Toronto, Ont.—A fire which occurred in the Morrison Brass Works, 93 Adelaide street west, caused damage to the extent of $550 last Tuesday.

Englehart, Ont.—The Charlton Englehart Power Co. will have their new plant fully installed and ready for furnishing power by May 1. The plant consists of practically three units.

Chatham, Ont.—C. S. Cornelius, of the Canadian Wolverine Co., whose plant was destroyed by fire on April 10, states that the work of re-construction will start as soon as possible.

Port Hope, Ont.—J. E. Murphy, president of the International Tool Steel Co., has been here conferring with the Harbor Board with regard to establishing a plant for making high grade steel.

Edmonton, Alta.—Edmonton Metal Works, Ltd., is erecting a factory building, 75 by 125 feet, costing $25,000. W. J. Magrath is manager of the plant, which will be equipped with modern machinery.

West Lorne, Ont.—The Southern Ontario Gas Co. will install a $200,000 purifying plant at its fields at Port Alma, Tilbury district, to purify all the natural gas to be sold in Western Ontario. This plant, according to the announcement of Frank C. Tomb, will be in operation next fall.

Berlin, Ont.—Berlin will secure a large automobile industry this summer, according to plans just completed. The Regal Automobile Co., of Detroit, will amalgamate with Nyberg Auto Works, of Anderson, Ind., in the establishment of a Canadian factory.

Medicine Hat, Alta.—A building permit has been given out for the radiator factory which is to be built on the South Industrial site by L. Carey Wright. The structure will be of steel and concrete, with factory roof, and will cost $35,000. The dimensions will be 80 by 288 feet. Excavation work has already begun for the foundations.

St. John, N.B.—The announcement is made in connection with the Maritime Motor Show in St. John which has just been closed, that the Dominion Motor Car Co. will put up a factory at Coldbrook, three miles outside of St. John, near the factory of the Ford Company. The new company will assemble there sections of an English car which will be placed on the market throughout the Dominion.

Electrical

Hamilton, Ont.—The Hydro-Electric Commissioners have awarded contracts for street lighting fixtures to the Tallman Brass & Metal Co., of this city, and transformers to the Crocker-Wheeler Co., of St. Catharines.

Winnipeg, Man.—The development of the new Winnipeg electric power plant at Grand Bonnet falls on the Winnipeg river has been started. A gang of 400 men is actively at work cutting out the right of way for a private railway line of 12 miles that the company will build from Lac du Bonnet to the power site. J. G. White & Co. of New York, are the engineers.

Fredericton, N.B.—The construction of a dam across the St. John River at Meductic is proposed by the St. John River Hydro-Electric Company. The project has been laid before the Legislature, and its promoters claim the work will cause an ultimate expenditure of some $3,650,000. The proposed dam will cross the St. John at Meductic, above Fredericton, and transmit power to Fredericton and Marysville, down the valley of the river, over 30 miles to St. John.

Orillia, Ont.—It is rumored that the Ontario Hydro-Electric Commission has completed the purchase of the Big Chute power plant from the Simcoe Railway and Power Co. of Midland. The Commission has for some time been procuring power from this source to supply Midland, Penetanguishene, Barrie, Collingwood, Stayner, Coldwater, Waubaushene, Elmvale, and intermediate points.

Collingwood, Ont.—At a largely attended meeting of citizens under the auspices of the local Board of Trade, a Collingwood branch of the Hydro Radial Union was formed.

Municipal

Walkerton, Ont.—The town council have decided to purchase a road grader.

Trenton, N.S.—The installation of a water supply system, at a cost of $50,000, is proposed by the town council.

Halifax, N.S.—The city council are considering the question of building a municipal abattoir.

Windsor, Ont.—The city council has purchased a steamer from Seagraves, Ltd., and are considering the purchase of auto trucks.

Port Arthur, Ont.—The city council has voted the Port Arthur board of trade $2,500, provided it does the publicity work of the city.

Fort William, Ont.—The city council have appropriated $700 for the purchase of an automobile for the chief of the fire department. Tenders will be called shortly.

Welland, Ont.—At a meeting of the Trades and Labor Council recently the garbage question was discussed at length and a resolution passed advocating an incinerator plant for the town.

Ford, Ont.—A board of trade has been formed here and the following officers elected: Walter L. McGregor, president; Joseph L. Reaume, vice-president; W. A. Komer, secretary; F. W. Johnson, treasurer.

Port Arthur, Ont.—The Customs receipts for the fiscal year just closed passed the million-dollar mark for the first time in Port Arthur's history. The event was celebrated by the officials and staff sitting down to an enjoyable banquet.

Weyburn, Sask.—Four by-laws, viz.—Fire hall, $8,500; waterworks, $105,000; electric plant, $27,000, and sewage disposal, $15,000, will go before the burgesses on May 5, which will allow time for the necessary advertising of the measures. City Clerk Inwards was appointed returning officer for the occasion.

New Liskeard, Ont.—The fire and light committee recommend the purchase of a hook and ladder truck for the sum of $1,050, to be paid for in ten-year debentures. The ratepayers are asked, on April 22nd, when voting on the other money by-laws, to give their opinion as to the advisability of securing the equipment.

Stratford, Ont.—By-laws covering $65,250 were given a second reading at a meeting of the city council on April 20, and the date on which the people will vote on them was made May 18. The five by-laws are:—$22,000 for a new ornamental street lighting system; $10,000 for improvements to the Agricultural Park; $11,500 for an incinerator; $17,250 for additional fire equipment, and $4,500 for a combination chemical and hose wagon, the ratepayers taking their option of a motor-driven or horse-drawn vehicle.

Toronto, Ont.—Works Commissioner Harris has recommended that the contract for the additional filtration plant at the island be awarded to the John ver Mehr Engineering Co. of London and Toronto, as engineers, and Wm. Cowlin & Sons, of Toronto, as contractors, at a cost of $1,066,282. Five tenders were received, as follows: (1) $1,096,277; (2) (Ver Mehr Co.) $1,777,054; (3) $1,500,000; (4) $1,197,580; (5) $1,733,463. The second tender was on the basis of a 72,000,000-gallon plant. A reduction of $110,772 is made from the original figure to bring it down to a 60,000,000-gallon plant as required by the city. The new plant will be that known as the Ransome Drifting Sand Filter, comprising practically a combination of the slow sand and mechanical methods. It will be the largest plant of this system on the continent.

General Industrial

Port Elgin, Ont.—W. A. Mitchell will build a canning factory here.

Toronto, Ont.—The Harris Glue Company will move their plant from 994 Danforth Avenue.

St. John, N.B.—The Jardine & Rive Company will probably build a silicate brick plant at Ketepec.

Port Arthur, Ont.—J. J. Stewart, of Chicago, is at the head of a company who may build gas works here.

Peterborough, Ont.—The Provincial Legislature have appropriated $3,125 for the improvement of roads in this district.

Lindsay, Ont.—On April 13 a fire completely destroyed the elevator owned by Thomas Skuce. The machinery was also destroyed.

Strathroy, Ont.—A by-law will be voted on to authorize the granting of concessions to a company who will build a shoe factory here.

Embro, Ont.—It is reported that Libby, McNeil & Libby, of Chicago, may build a plant, to cost $100,000, to make condensed milk.

Sarnia, Ont.—The Stewart Co., Ltd., are making an addition to their factory. The extension will be 40 x 60 feet, and will be used as a store house for canned fruits.

Iroquois Falls, Ont.—Plans for the erection of paper mills to cost $100,000 have been drawn for the Abitibi Pulp & Paper Co. by Geo. F. Hardy, engineer, New York City.

Wiarton, Ont.—The by-law voted on April 16 for granting a loan of $25,000 to the Canadian Casket Co. resulted in a sweeping majority for the company; 325 votes for and 40 against.

Regina, Sask.—The Western Tire and Rubber Co. will start construction work on a factory in about two months which will cost about $175,000. J. A. Westman and E. D. McCallum are interested.

Courtright, Ont.—Natural gas will, it is expected, be here by June. Representatives of the Union Gas Co. have completed the surveys for the new line, which will be supplied from the main, which runs to Sarnia, six miles distant.

Coaticook, Que.—A site for the new factory to be built by the town for the Charles Neidner, Sons & Co. has been purchased from Gendrean, Boulay & Durocher, for the sum of $900. It is expected that the factory will be commenced very shortly.

Medicine Hat, Alta.—F. A. Boeye, commissioner for the Dunmore Development Company, states that the company has signed up two new industrial concerns to employ a total of 115 men, the particulars of which would be announced in a short time.

Sherbrooke, Que.—The Whiting & Davis Manufacturing Co., jewelers and silversmiths, of Plainville, Mass., will establish a branch of their New England factory in Sherbrooke. Mr. Cooke, the manager, states that the company will occupy a portion of the Peerless Jewelry Co.'s building for the time being.

Harriston, Ont.—It is understood that McColl Bros., of Toronto, who lost their oil plant here by fire on April 4, have decided to continue the Harriston branch of their business. It is the firm's intention to erect a substantial brick building with an up-to-date plant.

Port Arthur, Ont.—The sum of $16,700 has been set aside in the supplementary estimates of the Ontario Government for roads in the Port Arthur district. In addition, $60,000 has been set aside for Mr. Whitson's work in this district out of the special grant of $5,000,000 for Northern Ontario development.

Guelph, Ont.—A change in the management of the Raymond Manufacturing Co., Ltd., has been effected, and the business taken over by the Trusts and Guarantee Co., of Toronto, administrators of the Kloepfer estates. They will continue to manufacture sewing machines and cream separators. The following officers were appointed:—President, E. B. Stockdale, Toronto; vice-president, W. J. Boland, Toronto; secretary, C. S. Hamilton, Toronto.

Sarnia, Ont.—The Union Gas Co., which supplies Sarnia with natural gas, has made a contract with the owners of the Fairbanks gas well at Oil Springs whereby the gas company secures control of the output of natural gas from that well and any other well that the Fairbanks syndicate may locate in the future. The company intends to pipe the gas to Sarnia and Petrolea, and work on the line will be started at once. An order has been given for $500,000 worth of pipe for the new line, and it is expected that the Oil Springs gas will be piped into Sarnia within six weeks.

Railways—Bridges

Toronto, Ont.—The Morrisburg & Ottawa Electric Railway has been given the right to extend its borrowing powers from $20,000 to $30,000 per mile.

Toronto, Ont.—Another extension of time has been granted the Niagara Falls, Welland & Dunville Electric Railway for the completion of their line. The time limit is now March, 1916.

Owen Sound, Ont.—A syndicate proposing to build a street railway in Owen Sound, is seeking a 25-year franchise from the town and also proposes that the town guarantee stock in the company.

Montreal, Que.—The C.P.R. is considering a proposition for the electrification of its terminals and the addition of two tracks to the present tracks feeding Windsor street station, at a cost of $1,000,000.

St. Thomas, Ont. — It is understood that the Michigan Central Railway has prepared plans for the viaduct under the tracks in the yards leading from the new work shops to Talbot street, and that the work will be commenced when the new structure is finished.

Toronto, Ont. — The Ontario West Shore Railway has been given a time extension of four years for the completion of the line. This power was granted by the Railway Committee of the Legislature on April 16.

Edmonds, B.C.—Estimated expenditure on roads and bridges in Burnaby this year will be $100,000, according to Municipal Engineer F. L. Macpherson's report, which was submitted at the meeting of the Board of Works held on April 6.

Ottawa, Ont.—The bill of the Montreal & Lake Victoria Railway, a line 320 miles long, to connect Montreal with the National Transcontinental Railway, providing for extension of time, was before the Railway Committee on April 2, but was not finally dealt with and will be up again after Easter.

Thorold, Ont.—At a special meeting of the town council, on April 13, a by-law was passed granting the right-of-way to the St. Catharines, Merritton and Thorold Electric Railway to the factory district. The line, which now ends at the head of Main Street, will be extended past the properties of the Ontario Paper Co., the Beaver Board Co., and the Pilkington Glass Works.

Ottawa, Ont.—According to legislation applied for, a company has been formed to build another bridge across the Niagara River, about half-way between Queenston and the present Suspension Bridges at Niagara Falls. The Ontario-Niagara Connecting Bridge Co. has given formal notice of application at the present session of Parliament for an act of incorporation, with power to construct and operate a railway and general traffic bridge over the Niagara River, near the intersection of the northern boundary line of Welland county with the river.

Toronto, Ont.—The route of the London, Grand Bend and Stratford Railway Co., which is now seeking incorporation by the Legislature, proposes a service through the principal municipalities lying between London and Lake Huron. The projected line traverses the townships of London, Lobo, East and West Williams, McGillivray to the city of Stratford, through the townships of Stephen and Usborne in Huron county, the townships of Hibbert, Fullarton, Biddulph, Blanchard and Downie in Perth County. The capital of the company is to be $2,000,000, with bonding powers of $35,000 per mile.

Building Notes

Edmonton, Alta.—The city will erect an addition to the Manufacturers' Building at a cost of $88,000. A new heating plant will be installed.

Sarnia, Ont.—The Dominion Salt Co. are making an extension to their factory. When completed the new building will be 100 x 40 feet and one-storey high.

Port Arthur, Ont.—The Methodists of Port Arthur will build a $10,000 parsonage this year on the church property for their pastor, Rev. G. K. B. Adams.

Toronto, Ont.—The Ford Motor Co. was granted a permit on Monday for a five-storey concrete factory and shop, to cost $160,000, in Dupont Street, near Christie Street.

Galt, Ont.—Plans for the erection of a new city hall have been accepted from a local firm of architects in competition, and work on the $25,000 building will be commenced at once.

Port Arthur, Ont.—Already preparations are in progress for a very busy building season. $80,000 is to be spent in residences in Mariday Park, all of them will be modern houses.

Calgary, Alta.—The new Industrial Housing Building will be seven storeys high and of reinforced concrete construction. Tenders are being received by Mr. A. Pirie, architect. The estimated cost is $200,000.

Port Arthur, Ont.—Work on the excavation for the new Customs building on the corner of Arthur and Water streets is being rapidly proceeded with. The structural steel for the entire building is on order, for delivery by June.

Toronto, Ont.—An enlargement will be made immediately of the new Bell Telephone building on Adelaide Street West. The building extends only about half-way back the lot at present, but plans have already passed the City Architect's Department for the extension of the building through to Temperance Street. The extension will be a five-storey brick, stone, terra cotta and steel fireproof building, costing $33,000.

Contracts Awarded

Toronto, Ont.—The Simcoe county council has awarded the Hamilton Bridge Co. the steel contract of the new 125-foot bridge over the Nottaswaga River at Nicolston. The bridge is to cost $9,000, and the steel contract is half the amount.

Port Arthur, Ont.—Marsh, Hutton & Powers, contractors of this city, have been awarded the contract for the new $755,000 breakwater to be constructed at Vancouver by the Dominion Government.

Toronto, Ont.—The York County Commissioners, at their meeting held on April 14, awarded the contract for the 40-foot concrete arch bridge on the Dawes road to McDougall & Toole, of Midland, for $3,137.

Saskatoon, Sask.—The contract has been awarded by the city council of Saskatoon to the Rensselaer Valve Co., of Troy, N.Y., for the supply of 12-inch cast-iron pipe at $38.70, 16-inch at $74.21, 18-inch at $97.97 and 20-inch at $125.52; totalling $672.80.

Port Arthur, Ont.—The contract for the construction of 2,500 feet of breakwater in the harbor here has been let to the Port Arthur Construction Co., Ltd. The contract amounts to $500,000 and the company have been authorized to proceed with the work as soon as possible.

Saskatoon, Sask.—The contract has been awarded by the city council of Saskatoon to the United States Cast Iron Pipe & Foundry Co., of Chicago, Ill., for the supply of cast iron pipe A at $41.80; (B) at $41.30, totalling $3.-186.10; and for specials at $75, totalling $975.

Montreal, Que. — Seventeen motor trucks have been ordered by the Board of Control for the Public Works Department, at a cost of about $100,000. The order includes nine "Delohaye" trucks, of which seven are of five tons capacity and two of three tons; four "Peerless" trucks, of five tons capacity; and four "Berliet" trucks, carrying five tons each.

Victoria, B.C.—Contracts for equipment required by the city electric lighting department were awarded by the city council on April 6, as follows: To D. L. Hickey & Co., and Hawkins & Hayward, in equal shares, for 5,000 pounds of copper line wire at $19.30 per 100 lbs.; to the Canadian General Electric Co., for two gross of arc light globes at $417.

Windsor, Ont.—Contracts for the transforming stations in Windsor and Walkerville for the Hydro-Electric system have been awarded. The Windsor contract was secured by H. J. Christman, of Hamilton, for $10,000. The Walkerville contract was given to Wells & Gray, of Windsor, their figure, $9,650, being the lowest bid. Engineers of the Ontario Hydro Commission say that power from Niagara will be available for use in Windsor by July 1.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Trade Gossip

The Hamilton Facing Mills Co., Hamilton, Ont., are starting to market graphite boiler compound. They have installed special machinery for making this specialty.

The D. McKenzie Machinery Co., of Guelph, Ont., have purchased a site and plans are being prepared for a new machine shop. The site is 80 x 200 feet, and will be entirely covered with buildings.

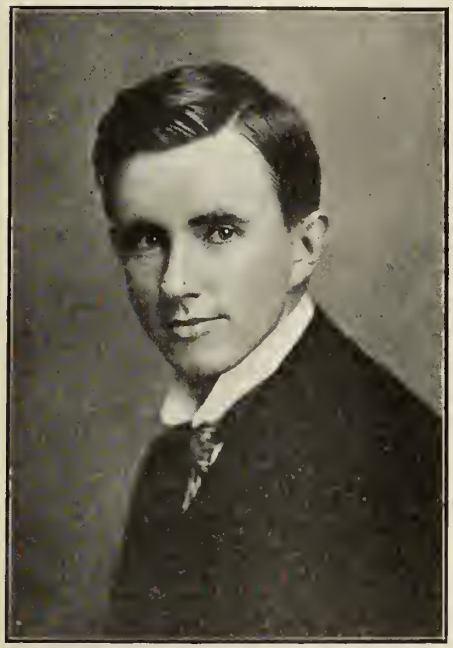
Great Lakes Transportation.—Announcement is made of the incorporation of the Great Lakes Transportation Co. with a capitalization of $1,000,000, and head office in Midland, Ont. Mr. James Playfair formed the new concern.

Nova Scotia Iron.—A report from Philadelphia states that the first cargo of free iron ore has arrived at that port from Nova Scotia. The cargo was from Louisburg, C.B. Preparations are being made for regular traffic in iron ore between these ports.

The Corbett Foundry & Machinery Co., of Owen Sound, Ont., have recently patented and are now making a steam towing winch. The winch has a cylinder 8 inches diameter by 8 inches stroke, and will carry 200 fathoms of 1 inch hawser with spooling gear.

W. H. Banfield & Sons, Toronto, advise us with reference to the recent Government contract for 100,000 parcels post boxes that they will simply supervise the manufacture; the International Mail Equipment Co. of Canada providing the plant, equipment and material.

Judgment for Machinery.—Judgment for $4,776.37 has been granted by Mr. Justice Middleton in favor of the Allis-Chalmers-Bullock, Ltd., for hydraulic and electrical machinery supplied to the Algoma Power Co. of Berlin, which operates a power house at Michipicoten. The suit was for $10,000.



The Wm. Hamilton Co., Peterborough, Ont., have been awarded a contract by the Corporation of the City of Windsor for the supply of all the ornamental iron standards required for the street lighting in the business district of the city. There will be approximately 300 of these standards required, and they will carry magnetite arc lamps.

Kingston, Ont.—The Davis dry dock was filled for the first time this season last Wednesday, and the new tug which this company built during the winter months was floated, as well as the two yachts which were also placed there for the winter. After these went out, the steamer Rideau Queen entered and will undergo a general overhauling and painting.

Will Ruin Industries.—J. G. Merrick, secretary of the Employers' Association, speaking on the minimum wage of $15 a week for unskilled workmen instituted by the City Council of Toronto, said that it would mean the ruin of industries and cause discontent among other workmen. He thinks it will have the effect of drawing men from the industries, during the summer months, who have been trained during the winter for special work.

Send Trade Commissioner.—Manufacturers in the Old Country having shown such a lukewarm attitude towards the proposed British exhibition train to tour Canada, the Canadian Associated Press learns that subscriptions are now being sought to send a British commissioner to Canada to study the opportunities for trade with the Dominion, especially in view of the opening of the Panama Canal. It is hoped a hundred firms at least will be willing to subscribe $125 each towards this object.

WHO'S WHO.

ALEXANDER GRAY,
President the Gray Mfg. & Machine Co., Toronto.

Personal

C. B. Carter, for two years municipal engineer of West Vancouver, has resigned.

John A. Wilson, city engineer of Kamloops, B.C., has resigned and has been succeeded by Mr. E. Kingwell.

R. H. Harcourt, sales manager of the Canada Steel Forgings, Ltd., Montreal, spent Easter at his home in Welland.

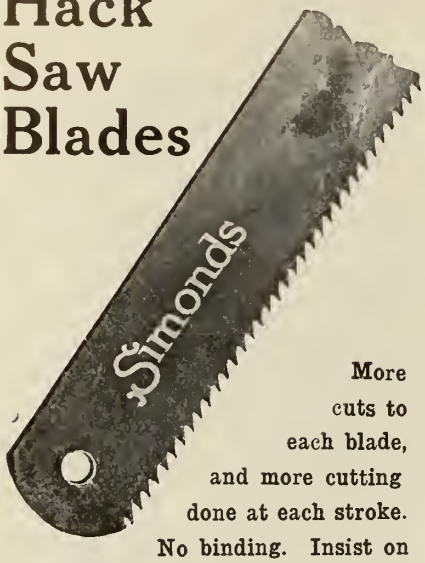
Sir William Whyte, late vice-president and director of the C. P. R., died at Coronado Beach, Cal., on April 14, at the age of 71.

W. G. Ross, president of the Montreal Harbor Commission, is proceeding to Nice, after completing his harbor investigation tour in Europe.

Alexander Watson died on April 18, in Toronto, aged 83. Mr. Watson was connected with the Gartshore Foundry Co., Hamilton, for many years.

C. M. Arnold, formerly city engineer of Lethbridge, has resigned his position with the C.P.R., as assistant engineer of the irrigation department in Alberta.

Herbert Douglas, lately of the mechanical department of the C.P.R., has received the Provincial Government appointment of assistant inspector of factories for British Columbia.



Graham Drinkwater, vice-president of the Canadian Fairbanks Morse Co., who for the past fortnight has been confined to his house with pneumonia, is making satisfactory progress towards recovery.

Norman A. Ruse, assistant commissioner of the Board of Trade, has been appointed publicity commissioner for the city of Regina, at a salary of $1,800 a year, his duties to commence immediately.

S. B. Wass, chief engineer of the Quebec Extension Railroad, is undertaking the work of assistant chief engineer of the St. Johns (Que.) Railway, a proposed line 174 miles long in Quebec and the State of Maine.

S. George Boswell, chief engineer of the Quebec Harbor Commission, has just returned from a six weeks' trip to the Old Country. While on the other side, Mr. Boswell inspected a new crane, dredge and tug, which are being built for the commission.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time. We can finish steel stampings in Nickel, Brass or Copper. Send us a sample order.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

Marine

Ottawa, Ont.—It is stated that a contract for buoy service on the Detroit River, has been awarded to Kenneth Fraser of Detroit, Mich.

Hamilton, Ont.—It is stated that the Dominion Government have appropriated a million dollars for harbor improvements. A large part of the money will be spent in the development of Stipes Inlet.

Wiarton, Ont.—The Canadian Tug & Towing Co. has purchased the Homer F. Warren, of the Shannon & Gary fleet. The consideration is private. The Kerner is being fitted out, and will be taken to Wiarton.

Sault Ste. Marie, Ont.—The Lake Superior Dry Dock and Construction Co. is going ahead with its programme of building a dry dock and shipbuilding yard. The $25,000 forfeit given the city still remains on deposit by consent of the company.

Port Arthur, Ont.—It is reported that the tender of the Port Arthur Construction Co., Ltd., has been accepted for the construction of the breakwater extension in Port Arthur harbor from its present termination opposite the C.N.R. coal docks towards Fort William.

Owen Sound, Ont.—Rumor here says that James Playfair will acquire the control of the Dominion Transportation Co., whose system includes the steamers on Georgian Bay, the Manitou, the Caribou, in addition to several tugs and steamers on Lake Superior.

Sarnia, Ont.—The engines of the steamer Matoa will be transferred to the steamer Peck. The Matoa is owned by the Reids, and was salvaged from the rocks at Point aux Barques. The Peck, which is at Detroit at present, is owned by the Reids and McKay, of Hamilton.

Ottawa, Ont.—Two million dollars for a harbor at St. Croix, Charlotte County, New Brunswick, was asked by a delegation which saw Hon. Robert Rogers and Hon. J. D. Hazen on April 1. It was claimed that the harbor is open all the year round, and is one of the best natural ports of Canada. The delegation got no definite assurance.

Quebec, Que.—Mr. A. Gravel, chairman of the Levis Board of Trade and member of the Quebec Harbor Commission, has received a letter from the well-known ship-building firm of Sir W. Armstrong, Whitworth Co., with reference to the establishment of a branch of that firm across the river at Levis, in connection with the new graving dock, on which work is to start in a few days.

Montreal, Que.—Preliminary work on harbor improvements estimated to cost this season $3,000,000 has been commenced, and include the completion of the 20-foot channel by diverting part of St. Mary's current, electrification and extension of the high level railway, besides dredging and improvement of wharves and piers.

Collingwood, Ont.—The Collingwood Shipbuilding Co. have handed over to the Windsor and Pelee Island Navigation Co. the new passenger and package freight steamer, "Pelee," which has been under construction in the yards during the past winter. On April 15 the steamer made her trial trip, maintaining a mean speed of 14.6 miles per hour.

Canada's Merchant Marine.—Capital estimated at $26,908,950, invested in 8,545 Canadian vessels, while 43,968 men and boys are employed in the marine service, according to the annual report just issued by the registrar of shipping. The number of vessels registered is 8,545, and the tonnage is 896,965, an increase last year of 344 vessels. Steamers number 3,847, and the tonnage 711,512. Of the 344 new vessels added to the register last year the value is $1,807,380.

Ottawa, Ont.—A delegation from St. Stephen, St. Andrews, and Milltown, recently asked $2,250,000 from the Government for the improvement of St. Croix harbor at the mouth of the St. Croix river. A favorable report of the possibilities of this harbor was made by Engineer A. D. Swan, and the delegation from Charlotte county wished to emphasize the recommendation and to have the approval ratified in cash. Hon. Mr. Rogers promised consideration.

Hamilton, Ont.—While in Ottawa with the deputation from Hamilton and other cities urging greater waterways and hydro radials, Engineer MacCallum had a conference with Hon. Robert Rogers, Minister of Public Works, and was assured that by the time the new Welland Canal was completed, Hamilton's canal at the beach would be deepened to the standard of twenty-five feet and converted into two channels, instead of one, with a pier in the centre.

Sarnia, Ont.—The Northern Navigation Company's steamer Saronic has been sold to the Canadian Steamship Company, and it will be used as a passenger steamer on the St. Lawrence River. The boat has been on the run between Sarnia and Port Arthur since 1883. When she first left the shipyards she was known as the United Empire. At the time of her launching she was considered the acme of shipbuilding, and her size at that time was considered immense.

Tenders

Ottawa, Ont.—Tenders will be received until Monday, May 11, 1914, for the construction of harbor improvements at Port Hope. Plans, specification and form of contract can be obtained at this department and at the office of Mr. J. G. Sing, district engineer, Confederation Life Building, Toronto, Ont., and on application to the Postmaster at Port Hope, Ont. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Wallaceburg, Ont.—Tenders will be received by the town clerk until Tuesday, May 5, 1914, for the following works:—(A-1) Laying water mains; (A-2) laying sewers; (C) water tower and foundations; (D) water pipes and specials; (E) fire hydrants, gate valves and valve boxes; (F) mechanical pressure filters; (I) intake and basin; (M) laying force main; (S) furnishing sewer pipes. Plans and specifications may be seen at the office of the engineers, Chipman & Power, Mail Building, Toronto, or at the resident engineer's office, Wallaceburg.

Brantford, Ont.—Tenders will be received by the secretary-treasurer of the Board of Water Commissioners until Thursday, April 30th, 1914, for the following works:—Contract (B) fireproof pump-house; contract (G) pumping machinery; (a) two four-million-gallon turbine pumps and two motors to operate same for domestic service; (b) two four-million-gallon booster pumps for fire service, motor-driven; (c) steam turbine alternative for operating booster pumps. Plans and specifications may be seen at the City Hall, Brantford, or at the office of the engineers, Chipman & Power, 204 Mail Building, Toronto.

Catalogues

Air Compressors.—The Canadian Ingersoll-Rand Co., Ltd., Montreal, Que., have sent us a leaflet descriptive of the class "N" compressors which they make. The advantages claimed for this compressor are set forth in a comprehensive manner accompanied by illustrations of other types. Copies of this leaflet may be obtained by writing the company.

Grinding Machinery. — The Ford-Smith Machine Co., Hamilton, Ont., have recently published an attractive catalogue dealing with the full line of grinding machinery, which they make. A detailed description is given of each type, together with a specification covering the principal dimensions. The catalogue has an index and is fully illustrated with excellent half-tones showing clearly the general design of each type of grinder.

Direct Current Generators, small, belted type are described fully in bulletin No. A4188 issued by the Canadian General Electric Co., Ltd., Toronto. The bulletin contains a detailed description of the C.V.C. type of generator, with illustrations showing all the parts disassembled and the belt-tightener attachment. Diagrams are included accompanied by a table giving the principal dimensions and other data for each size of generator.

Fluor Spar for foundries and other purposes is the subject of two leaflets which we have received from Geo. G. Blackwell, Sons & Co., Ltd., Liverpool, England. In one leaflet the claims for fluor spar as a flux and ferro-silicon for foundries, are dealt with. The other leaflet contains a list of metals and foundry specialties handled by the company, accompanied by a number of illustrations reproduced from photographs taken of the mines in Derbyshire where the spar is obtained and method of transporting same to the railway.

Avery Automatic Scales are described fully in catalogue No. 117, recently is-

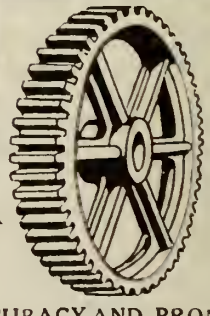
sued by the Avery Scale Co., North Milwaukee, Wis. The scales dealt with in this catalogue are principally designed for weighing coal, although some of those described are intended for handling other materials. The principal features embodied in the "Avery" automatic scales are dealt with in a comprehensive manner, accompanied by illustrations of the scales and also of several installations in boiler rooms. The "Avery" patent totalizer is also described and illustrated. On the concluding page is a diagram of an automatic coal scale with a table giving the approximate dimensions for the various sizes. Copies of the catalogue may be obtained from the Canadian agents, Canadian Allis-Chalmers Ltd., Toronto, Ont.



Book Reviews

Hydraulics, by Ernest H. Sprague, A. M.I.C.E., 184 pages, 4½ x 7 inches, 89 illustrations and several tables. Published by Scott, Greenwood & Son, London, England. Price 3/6, (.84) net. This is a new work on hydraulics, being the tenth volume of the "Broadway Series of Engineering Text-Books." It has been written as a text-book for students and engineers, and compiled chiefly from the lecture notes of the author, who is assistant professor of engineering at the University College, London, England. In this volume the author has treated the subject in a comprehensive manner, and has not gone too deeply into the theory of hydraulics, although when dealing with a subject of this kind, mathematics necessarily assume considerable importance in the solution of the various problems. The calculus has been used freely for, as the author says, the necessity of the case is sufficient reason for its employment. It has been assumed that the student will have a good knowledge of mathematics and so should not have much difficulty in understanding the formulae and examples, as the latter have been worked out in full, each step being printed in clear type. These examples form an important feature of the book and enable the student to obtain a better grasp of the subjects than would otherwise be the case. In addition to the series of examples given with each subject, there are five pages devoted to miscellaneous examples, not worked out, although the answers are given. The book contains six chapters dealing with such subjects as the principles of fluid pressure, liquids in motion, discharge through orifices, weirs, etc., flow in pipes and channels, pressure of water and application to motors; the last chapter being devoted to pumps and the hydraulic ram. The book is fully illustrated and has at the end, a number of mathematical tables, and some useful data on hydraulics.

solve your drilling problems for you.

It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

Elastic Rotary Blow Riveter.

What Is Your Riveting Problem?

We have helped many manufacturers to larger profits on their riveted work, and shall be glad to show you how you can turn out more and better work at less cost.

May we have samples to rivet for you without charge?

We would like to send you catalog.

The F. B. SHUSTER CO. NEW HAVEN CONN.

Formerly John Adt & Son. Established 1866
Automatic Straighteners and Cutters for Rounds, Hexagons, Wire Formers, etc.

The First Law

of nature is self-preservation. To save yourself is natural. But why need you have conditions in your plant to warrant the carrying out of this law? One of the worst danger factors you have to deal with is the projecting set screw. Why not safetify your factory by using

Allen Safety Set Screws

throughout. A small article but a great big trouble saver.

Your dealer carries them, so the next time his salesman calls just say ALLEN to him, and see how he "comes back." Send for circular!

THE ALLEN MFG. CO., Inc., HARTFORD, CONN.

We Specialize in ELECTRICAL REPAIRS

The experience we have gained by repairing the machines of all makers, all sizes, all voltages, and currents is rarely secured by the manufacturer. If he makes your repairs it **may** be as good as before, **but no better.** When we tackle a job it is our aim to make the weak part stronger than the original—and we invariably do it.

A Job Well Done is an Ad. for Ever

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use **two** files where they heretofore only used **one.**

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

Nicholson-Made-Files

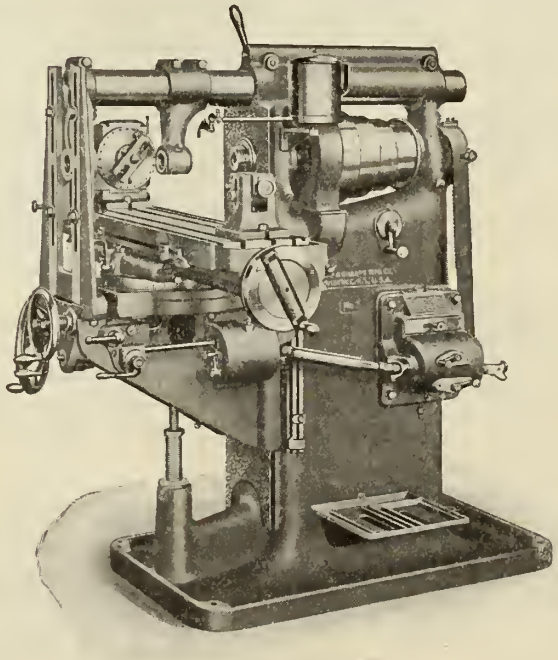
"FILE FILOSOPHY"—A 50 years' education on files in an hour, and our Catalog, sent FREE on request.

Features of B. & S. Spiral Head



HARDENED STEEL WORM WITH GROUND THREADS
insures long life and maintenance of original accuracy of threads.

GRADUATED INDEX SECTOR.
You can set sector arms to include any desired number of holes in plate without counting them.

ADJUSTABLE INDEX CRANK
For making delicate adjustments. Index pin can be moved to nearest hole in plate without disturbing work. Work can be adjusted without withdrawing pin.

GENERAL DESIGN.
Strong and rigid. Convenient to operate.

Write for further particulars.

Have You a Buyer's Power ?

¶ Whether you are a Purchasing Agent or a Purchasing Proprietor a heavy load of double responsibilty is yours every time you make a decision and sign an order.

¶ Can you discharge that responsibility with a brain charged with instantly available information?

¶ We can furnish an indexed brain to any buyer of machinery. We have been doing it for several years to some of the keenest and highest paid Purchasing Agents in Canada. This is how we do it:

¶ Half a dozen pages from the back of "Canadian Machinery" you will find a Buyers' Directory. This is arranged alphabetically according to the name of the machine. Below each item is given a list of the most reliable makers.

¶ If you want a Drill or a Lathe, a Milling Machine or a Motor, a Reamer or a Riveter, a Planer or a Punch, or any kind of machine or piece of equipment, all you have to do to bring the best makers to your desk is to consult the Buyers' Directory in "Canadian Machinery."

¶ Here is to be found a list of the most dependable manufacturers. It is a universal catalog of all your needs and a ready reference guide to good buying. It is an Honor Roll of Progressive Machinery Makers. It is a brain saver and a reputation builder for purchasing agents—a time saver and a money maker for men who do their own buying.

¶ Take a careful inventory of your present and possible requirements. Note what machines or supplies you will have to purchase in the near future. Consult Machinery's Buyers' Directory and write for the catalogs and the literature of the firms, who are in a position to supply you. Get loaded for emergencies. Fill up on information. Decide before you have to who can best meet your requirements.

¶ Perhaps the very machine or machines you will need are illustrated and described in this number of Machinery. Look up the Buyers' Directory and then the Advertisers' Index (just inside the back cover.) Better still, take a look through all the advertising pages and read as you run. It won't take you long and it will do you a whole lot of good.

¶ Let "Canadian Machinery" help you in your buying, and tell where you obtained the information

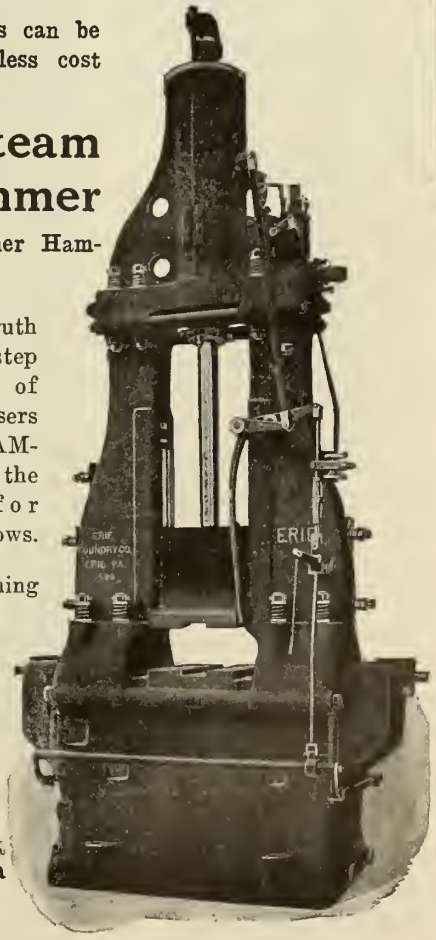
ALL CASTINGS GUARANTEED TO YOUR APPROVAL



More drop forgings can be produced and at less cost with an
"Erie" Steam Drop Hammer
than with any other Hammer on the market.

If you doubt the truth of that statement, step into the factories of some of the large users of "ERIE" HAMMERS and ask the man responsible for production. He knows.

We build Trimming Presses also.

Send for bulletins.

TRADE MARK TRADE MARK

John Wanamaker says that advertising doesn't jerk—it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

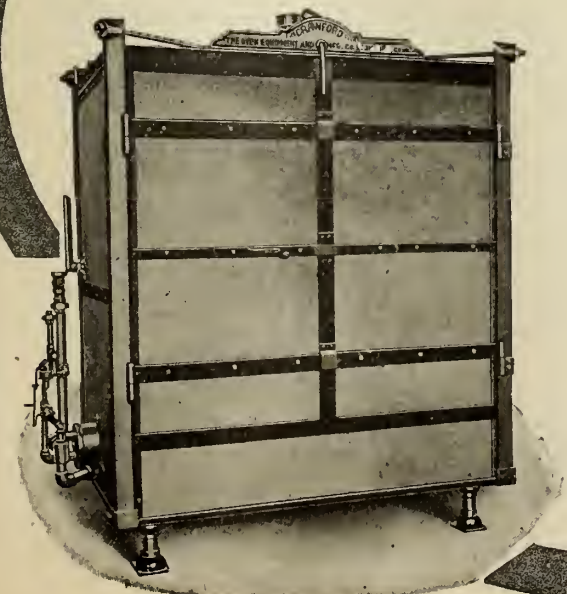
Economize in the Tumbling Room

Time costs money,
Power costs money,
Space costs money.

Globe Tumbling Barrels

save time in running, in inspection, in loading and in emptying. One operator can take care of many Globe Barrels. Globe Barrels use less power and occupy less space. Economy in every direction.



8 Stock Sizes Listing $50 to $170.

Just Brains and Skill and Honest Goods

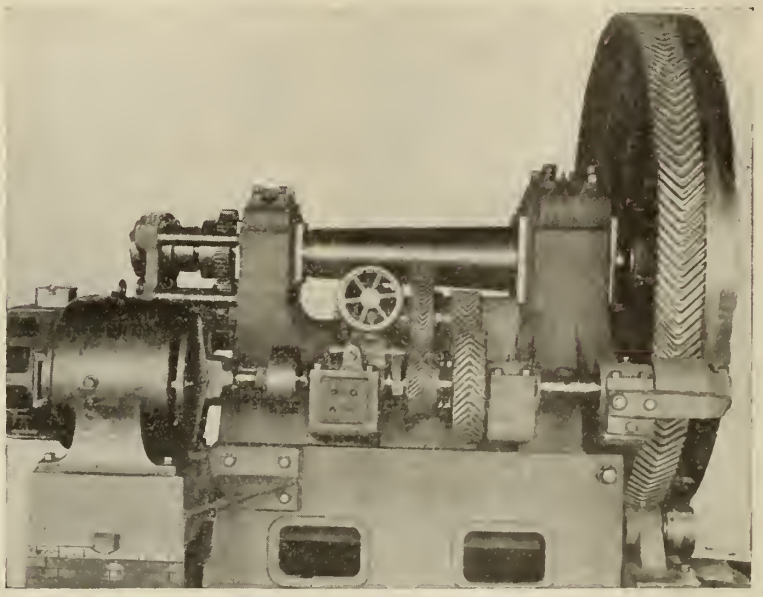
That's what we put into our ovens. It's all they need. The positive forced circulation from the blower and the **Enclosed Flame Gas Burner** have solved so many problems for so many manufacturers that we feel sure they can help you.

CRAWFORD
Sectional Ovens

have been the means of improving products and reducing costs, while at the same time increasing output.

Won't you let us know your trouble? We'll take pleasure in helping you.

Our folders on "Correct Core and Mold Drying," or "Drying Out Armature Coils" will interest you.



Write us to-day.

A Thread To Tap?

NoTimeTo Waste?

A Geometric Adjustable Collapsing Tap is What You Want.

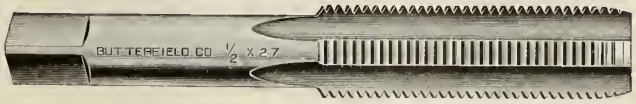
Whether a Straight Thread, or a Standard Pipe Thread,

The Geometric Will Tap It Out.

Set the trip for the desired length, and when this is reached the chasers will automatically recede. Draw out the Tap. Move handle to again adjust the chasers, and continue your thread tapping

Without Waste of Time, Material or Effort.

Geometric Adjustable Collapsing Taps are for use on Turret Head Machines or on Live Spindles.



ALWAYS TAP TO SIZE. **CHASERS REGROUND OR RENEWED AT SLIGHT COST.**

Six Busy Vertical Shapers

Large manufacturing concern proves wide usefulness of these distinctive tools. Highly efficient on die work as well as all regular slotter and horizontal shaper jobs.

Why There Should Be Some Busy Ones in Your Shop

Great Range. In the first place, the Vertical Shaper is a machine of great range and you should never have any difficulty keeping it busy. More adaptable and accurate than horizontal shaper or ordinary slotter.

Angular Adjustment of Ram is a new feature, advantageous on a large variety of work, especially in the working out of die clearances.

Convex, Concave or Irregular Surfaces are handled with greatest ease.

Swiveling Ram Head enables tool to be set in most advantageous position. Also all sides of work can be finished at one setting.

When Working to Line, tool enters work where line is scratched, and line can be accurately followed.

Most Conveniently Operated. The controlling mechanism is constructed and located with view to affording greatest possible convenience in operating the machine. Ram may be started or stopped independent of driving motor or belt by means of clutch.

Stability and Accuracy. While the stability and power of the machine are such as to withstand the severest manufacturing service, the Vertical Shaper is a precision tool in every particular.

Two Sizes—With $6\frac{1}{2}$" and $10\frac{1}{2}$" maximum stroke of ram.

Write for new 12-page circular "Vertical Shapers" fully describing and illustrating both sizes.

Ever unscrew a nut with a chisel?

When it's nicely rusted up, and stuck away in some corner where you can't get a big wrench on it to save your neck. Then it is that you have to recourse to a chisel, and collect a bunch of raw knuckles before you have that nut adrift.

The

Bemis & Call Adjustable "S" Nut Wrench.

would have saved your knuckles and got that nut off at the same time. Its large diameter operating nut allows you to "feel" for the bolt and adjust the wrench with one hand. Its sturdy construction means long life; its interchangeable method of manufacture means easy replacements.

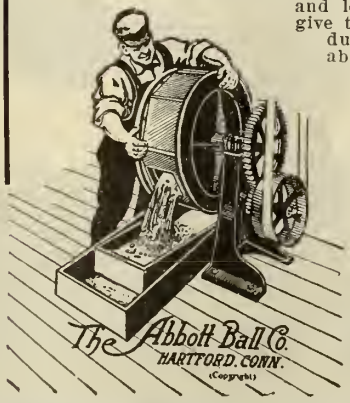
Bemis & Call Hardware and Tool Co.

SPRINGFIELD, MASS., U.S.A.



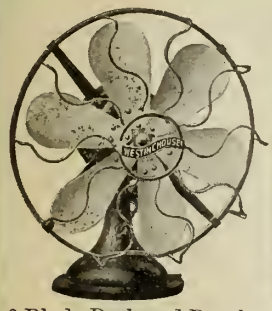
75% Reduction!

in your polishing costs.

Doesn't that sound pretty good to you? Isn't it worth going after if we show you the way?

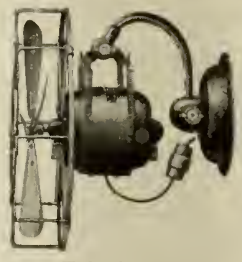
It's very simple — reducing your polishing expenses—replace that long line of buffing operators by one man and two or more

Abbott Burnishing Barrels



and let the glass-hard steel balls give to your product a finish—more durable than that of polishing at about a quarter the cost.

The Abbott effects this saving because it handles hundreds of pieces at a time and requires an operator only at loading and unloading times.



Send us samples to burnish and write for our free book.

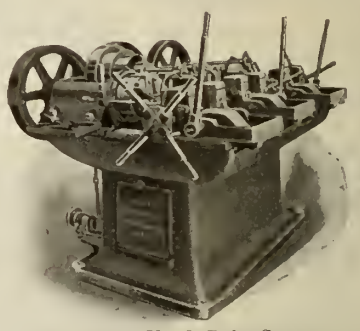
The Landis Die, showing the threads milled in the side.

With Landis Dies the Cutting Condition is Correct

Landis Rotary Die Head.

CORRECT, because burnishing and dragging are eliminated. CORRECT, because they produce the best results. CORRECT, because the rake angle can be varied to suit the nature of the material being threaded.



HOBBED DIES are rapidly becoming classed among the things "that were" and "the also rans." Modern LANDIS DIES are replacing them and reducing threading costs at the same time.

Catalogue on request.

Milling Spirals With a KEMPSMITH No. 3 Universal With Universal Milling Attachment

You do not want to put a Universal Attachment on your tool room miller every time you want to mill a twist drill, a spiral milling cutter, or a spiral reamer. But if you have a

KEMPSMITH UNIVERSAL

and your spirals have too big an angle to be cut by swiveling your table, you can mount a Universal Milling Attachment, as illustrated right here, and the rigidity of your whole equipment and especially of your Dividing Head, will enable you to do work like this if you have a Kempsmith.

The worms are nearly 3 11-16" in diameter, and the depth of thread is nearly ¾". Each worm is 3⅜" long.

Roughing and finishing cuts are taken and each worm is finished complete in 43 minutes.

Let us send you bulletin of this No. 3 Universal, and also catalog.

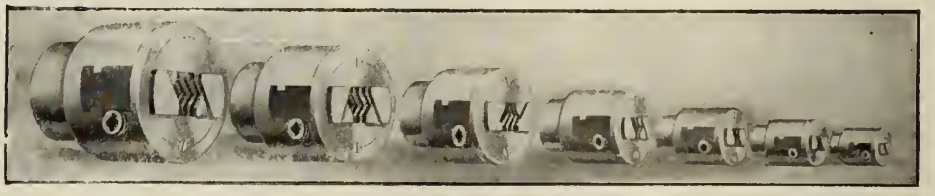
The Columbia High-Speed Chuck.

Chucks for all Requirements

The

COLUMBIA HIGH-SPEED CHUCK



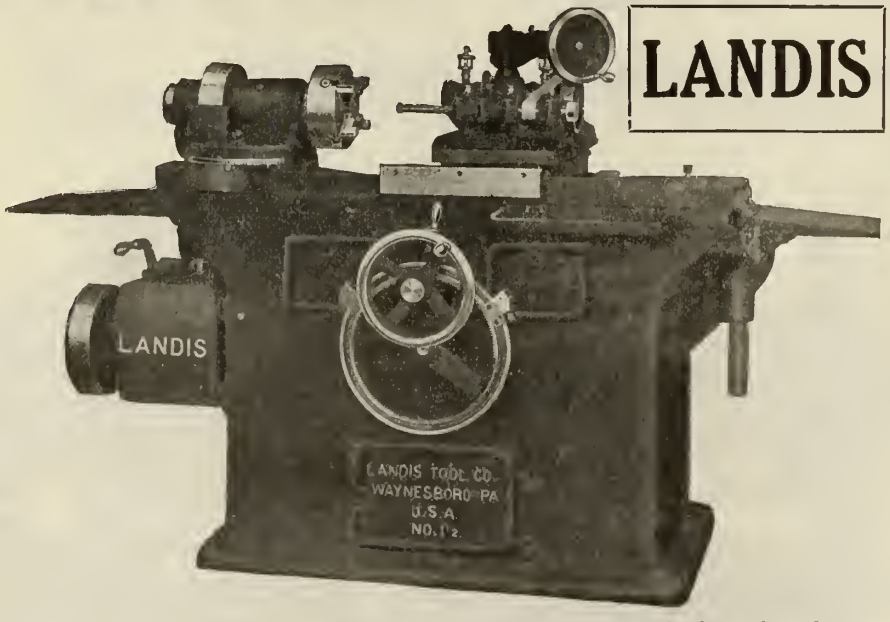
The Superior Lathe Chuck.

with hardened steel scroll plate possesses considerable more power and wear qualities than any other chuck on the market.

The Superior Lathe Chuck

The outside diameter of The Superior Universal Chuck is larger than its gripping capacity which gives additional strength. It is fully guaranteed for accuracy.

Ask for circulars and prices



Our discounts will interest you.

The Superior Drill Chuck

The screws are made of nickel steel, rendering them practically unbreakable—The steel guard ring increases the strength of the chuck.

SCHUCHARDT & SCHUTTE -:- 307 Coristine Bldg., Montreal, Que.

For Accurate Straight or Taper Holes

LANDIS

Designed for both STRAIGHT and TAPER grinding, it grinds SOFT or HARDENED material with rapidity and accuracy.

Rigid swiveling headstock firmly clamped to main body of machine. The internal grinding wheel fixture is mounted on a massive base.

The swiveling point of the headstock is near the chuck, which prevents overhang of work.

Bed of machine webbed and rigid throughout; these ASSURE ACCURATELY GROUND WORK.

The stroke of the wheel along the work is quickly adjusted by the LANDIS positive quick-setting dogs.

Traverse speeds of wheel controlled by a single lever.

Holes ground by this method are accurate and in quantities duplicates are assured.

Special Internal Grinding Machine Circular on request.

How Much Of The Time Are Your Universal Millers Used For Cutting Spirals?

A PLAIN MILLER fitted with index Centres can do any tool-room job that a Universal can do except cut spirals

Cincinnati Plain Millers can also cut spirals.

The equipment consists of Dividing Head, Driving Mechanism and Spiral Milling Attachment, and will cut spirals of greater angle than any Universa will take in.

But spiral jobs are only occasional, anyhow.

THEN why not install a Plain Miller with Dividing Head for your tool-room work, and when a spiral job comes along, use the attachment?

This makes the ideal tool-room outfit—a Plain Miller for the regular work and a spiral cutting equipment when needed for the occasional job.

In a Cincinnati Plain Miller with tool-room equipment you have both a Plain and a Universal—two machines in one.

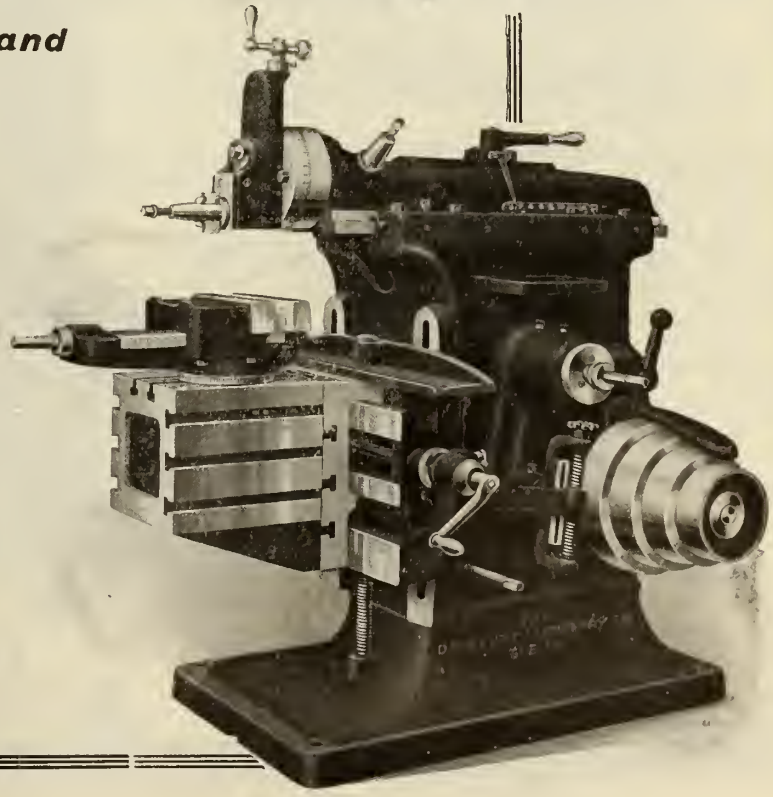
CANADIAN AGENTS: H. W. Petrie, Limited, Toronto, Montreal. Taylor & Young, Vancouver.

A New 16-Inch Shaper

is the result of a long-felt demand for this kind of machine.

OUTSTANDING FEATURES:

The column is heavy and strong, well braced and ribbed.



The cross-rail and table are of proper proportions with large bearing surface, shown in cut.

All bearings and sliding surfaces are hand scraped to surface plates and are fitted with adjustments for taking up wear.

All feeds have graduated collars.

Changes of feed and position of ram are made from working side.

We'll be pleased to quote you prices and furnish any information required.

The D. McKenzie Machinery Co.
Guelph, Ontario

NORTON

Loading in cylindrical grinding is frequently caused by running a wheel too slow, especially when crowding a hard wheel. At slow speed with plenty of power the grains would withstand this crowding without breaking away.

The way to overcome this is to use not only

NORTON GRINDING WHEELS

Alundum for Steel **Crystolon for Cast Iron**

at the proper speed but also to call freely upon such grinding facts as our experience has enabled us to collect.

Wilt Twist Drills Start Into the World in Perfect Physical Condition

They are perfectly designed and in perfect balance. They are machined to a marvelous degree of accuracy. They are hardened with scientific exactness.

No wonder they drill more holes of a given size per minute per dollar of cost. **Wilt Twist Drills** come honestly by their sturdy constitution. They inherit it.

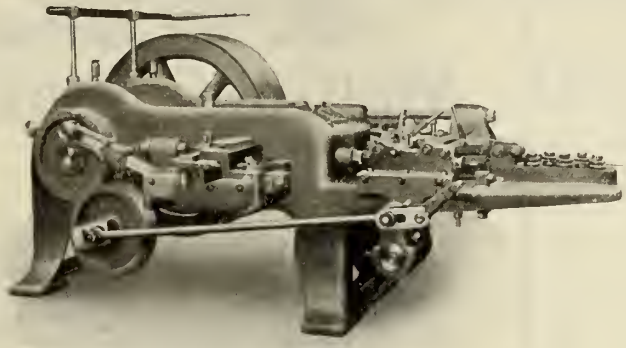
The stock they come from is the finest—most carefully selected, most accurately tested steel that can be bought.

It is steel with a pedigree, if you please—steel that has a long record of worthy performances back of it.

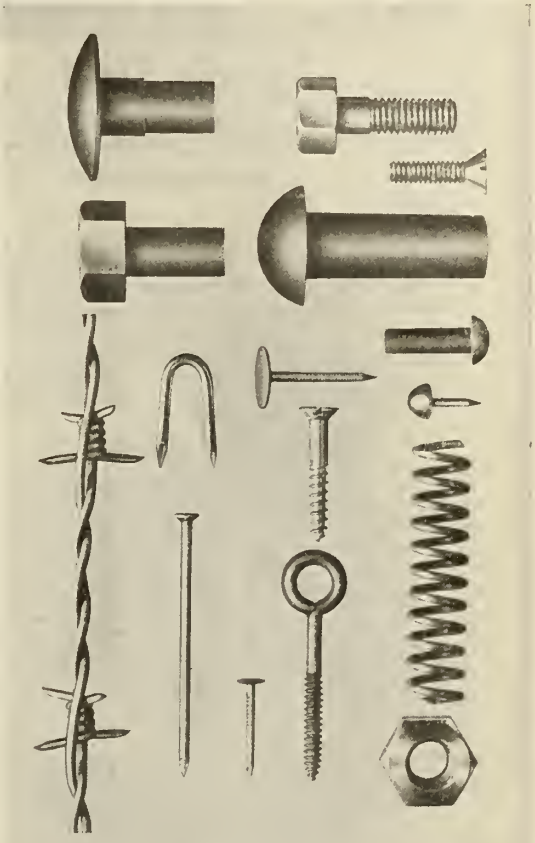
No wonder **Wilt Twist Drills** stand up better, last longer, and almost never break down under strain.

But the most essential difference in **Wilt Twist Drills** is found in the process by which they are made.

Instead of six or seven machining processes which have been necessary heretofore in the making of a drill, Wilt Drills are machined complete at a single chucking.



The rough stock goes into the automatic machine and comes out a perfectly cut Drill.



You can readily understand what that means in accuracy and uniformity.

Add to this exactness in machining the perfectly regulated hardening of the electric furnace, and you get some conception of **Wilt Twist Drill** quality.

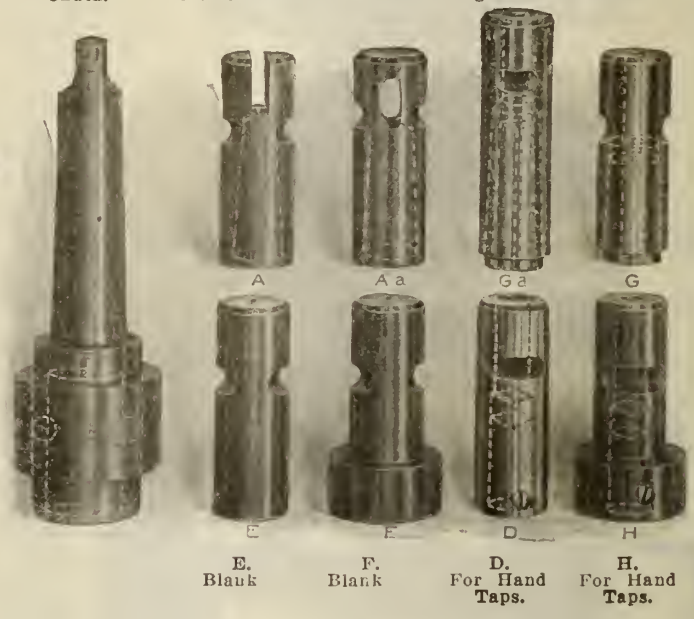
Magic Chuck Equipment



Have you ever considered how much time is lost inserting and releasing drills, when you use an ordinary drill chuck? The MAGIC CHUCK prevents this waste, because drills, reamers or taps are instantly inserted and released without stopping the spindle of your machine.

Send for our Bulletin 31—then place your order for a MAGIC CHUCK EQUIPMENT and be convinced of its worth.

Raise ring with thumb; collet and drill drops into hand

COLLETS

The MAGIC CHUCK is the correct Chuck to use in the manufacture of automobiles and automobile parts, and has been adopted by many concerns as the standard in a quick-change chuck.

We guarantee definite results and are prepared to demonstrate the advantages of the MAGIC CHUCK on your own work and in your own shops, if you will say the word.

The two great features necessary in a manufacturing proposition, accuracy in the finished product and economy in operation, are embodied in our MAGIC CHUCKS.

By a simple device, our GA Collets, you can reclaim all your broken tang drills. No need to turn the shanks down, or grind a flat on the remaining portion of the shank—because the tang has been twisted off, simply specify on your order GA Collets for broken tang drills, Morse Taper No. —, and you use up the drill instead of discarding it.

Send for Bulletin No. 31.

Wells Self-Opening Die

A New Source of Revenue

MODEL T.

The Most Intelligent and Economical Little Steel Workman that Ever Entered a Shop

An Extravagant Practice

It has been customary for so many years to reverse the machine after the thread has been cut, to back the die off the work, that little attention is paid to the extravagance of that ordinary operation. It is an extravagant waste of time, causes needless wear and tear on machine and transmission, and uses more power than is necessary.

Plug That Loop-Hole

by using the Wells Self-Opening Die. When the thread is cut the die opens automatically; the carriage is drawn back; the die closed and started on another cut, all in a fraction of the time required to reverse and back off an ordinary die. And the machine keeps on running smoothly full speed ahead.

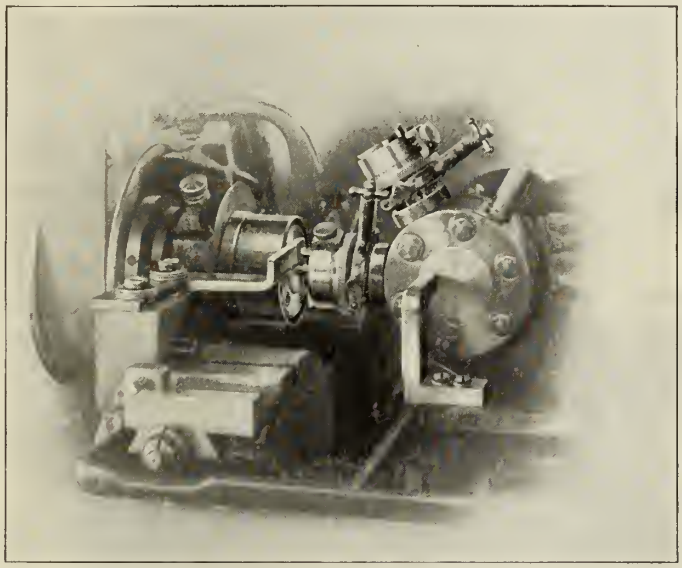
So strongly constructed and scientifically designed that it will not cut tapering threads.

Often Saves Its Price in a Week's Run

Sole Manufacturers
WELLS BROTHERS COMPANY
Division
Greenfield Tap and Die Corporation
GREENFIELD, MASS.,
U. S. A.

Makers of the famous Little Giant Line of Screw-Cutting Tools and Machinery.

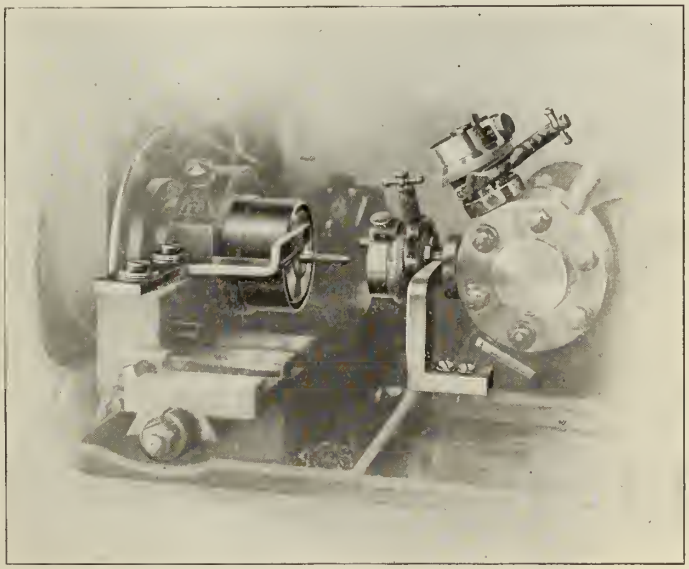
The Screw Thread is an ingenious mechanical device of unknown origin; a wonderful convenience if accurately cut—a miserable nuisance if not.



THE WELLS SELF-OPENING DIE

is a strong, rugged threading tool of simple mechanism, producing the accuracy of lathe-cut threads at twice the speed of ordinary dies.
Full information sent on request.

Wells Self-Opening Die

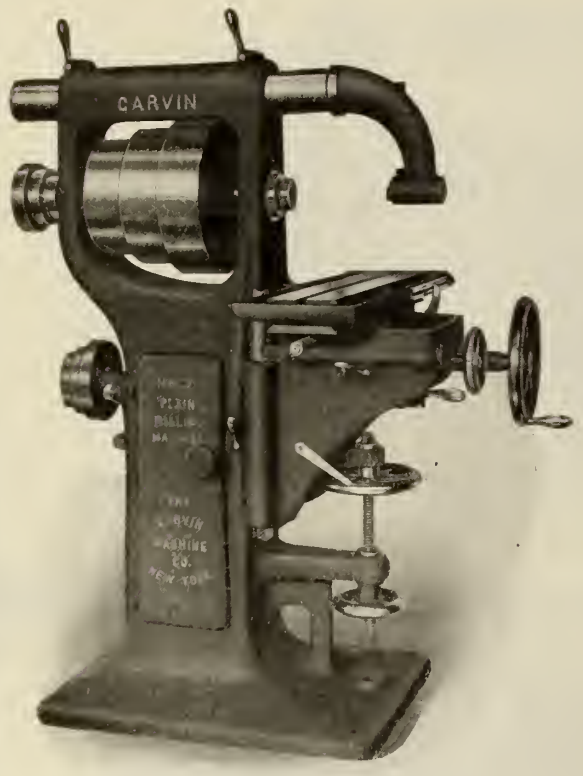


See How It Works

Two Wells Self-Opening Dies, Model V, are shown at work on a Brown & Sharpe Mfg. Co.'s Automatic Screw Machine, on very particular work, hence a roughing and finishing cut.

Die has just finished its cut and the chasers have spring open — note backward tilt of hand-lever.

Turret has drawn the die off the work and the stop has closed the chasers for the next cut — note forward tilt of hand-lever.



Models for all types of machines: Turret Lathes, Drill Presses, Hand Screw Machines, Bolt Threaders, Engine Lathes, Automatic Screw Machines (either turret or multiple spindle). Hundreds now in daily use in the largest shops of the United States, many of them under conditions abandoned as impossible by other opening dies.

A GARVIN MILLING MACHINE FOR EVERY NEED

No. 21 Plain Milling Machine
Use Code . . ABSORB

Fully 80 per cent. of the Milling Machines manufactured are used on manufacturing work, and a great majority of this 80 per cent. is used on what is called long set-ups. Did it ever occur to you that a simple Milling Machine without frills is made just as accurately as the so-called standard machine, and would effect a great saving in the first cost of your machine tool equipment?

Again, a less expensive operator can be used.

Think this over and investigate the merits of our No. 21 Plain Milling Machine. Made especially for manufacturing work and used by large concerns in gangs of six to one operator.

Machines are simple and accurate, having lots of power, and enough feed and speed changes to take care of the work they are intended for.

Adjustments—18 x 6 x 13 inches.

This Micrometer Saved Over 40 hours of his time!

On a job of turning 5,000 pieces, each having five different diameters, this micrometer was substituted for the several ordinary micrometers previously used by this mechanic on this kind of work. The saving in calipering with the

Starrett

Quick Adjusting Micrometer

was easily three seconds for each diameter, and each diameter was calipered twice, making a saving of 3x5x2x5000=150,000 seconds or more than forty hours. This is far more than the cost of the tool saved in that one job. Can you afford not to be familiar with Starrett tools?

The secret of the quick-action is the plunger in the end of the spindle which, when pressed, permits the micrometer to slide to its adjustment.

Starrett tools may be seen at any good hardware store or send for our big, new, free catalog No. 203 and learn what tools your work requires.

Starrett Tools and Hack Saws are sold at all good hardware stores. 42-281

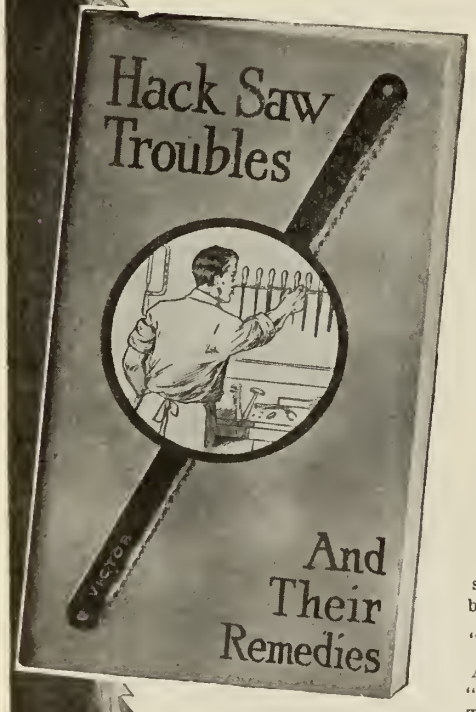
You can get more out of the VICTOR

because we put more into it

That word "quality," in our factory, is not for vague, general use. It's a **real principle**, the reason for every step we take in the manufacture and selling of



VICTOR Hack Saws

We pay more for the VICTOR Special Private Formula Steel that goes into the VICTOR.

More time and money spent on the machines that make the VICTOR, and our special processes of manufacture—

More inspections, and we inspect more carefully—

More blades rejected as being not up to our high standard (and most of those rejected you would consider good, serviceable blades)—

We bundle, box and ship the VICTOR a little more carefully—

We protect our retailers better, give them more and better sale helps, more and better real service—

We give the user more assistance in solving his hack saw troubles—

We do all these things a little better—in other words, we put more into our product — than any other hack saw manufacturer, because we know that—

You will get more out of the VICTOR—more speed, more cuts per blade, more satisfaction.

DELIVERY FROM STOCK—NO DELAY

John H. Hall & Sons, Limited
BRANTFORD, CANADA

No business, large or small, can afford to waste money by paying more to manufacture its product than is necessary. If your pipe threading is too high, let us help you lower it.

The illustration shows the No. 4 P.D.Q.C. Improved single pulley drive. Eight spindle speeds are obtained from a constant speed pulley or motor. A gripping chuck on each end of the spindle takes care of long lengths of pipe. They are equipped with the Peerless Die Adjusting Mechanism, so that when a change of dies is required, it is not necessary to remove a screw or a plate. There are no complicated parts to adjust and no light, delicate mechanism to break or get out of order. The driving mechanism is compact and almost entirely concealed in the bed. The cut-off device is attached to one of the steady slides, which places the cutting-off tool near the point of support. The bottom of the bed slopes toward the rear, draining the oil into the back away from the chips.

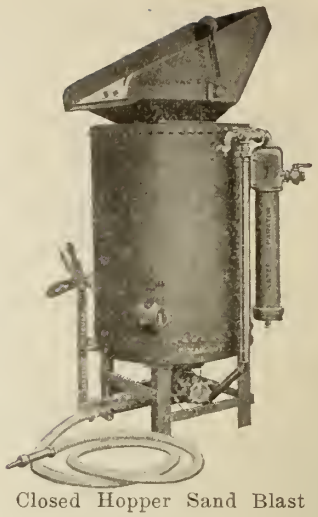
PRACTICAL BOOKS FOR PRACTICAL MEN

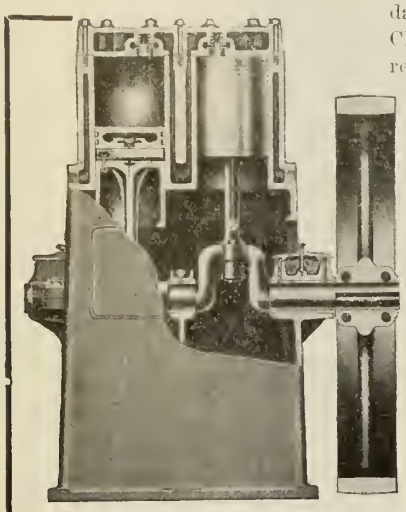
These books were written especially for practical self-instruction, by experts whose experience and standing make them authorities.
They are so clear that the beginner can understand them; so thorough that the trained worker can learn from them; so practical that they will give any man a working knowledge of the subjects that they treat, and save him both time and money.



They not only cover the fundamental principles of mechanical science, engineering practice, and business usage, but also present the latest developments and the accepted practice of the most successful men, in those lines.
They give men a practical knowledge of practical things, which enables them to think more accurately and to work more efficiently; and they compose the most helpful, reliable, and comprehensive series of home study books ever put upon the market.

AMERICAN SCHOOL OF CORRESPONDENCE, PUBLISHERS, 58th St. and Drexel Ave. CHICAGO, ILLINOIS.

Vital Factors in Profitable Casting Cleaning



A Good Sand Blast and Cheap Air

Curtis Sand Blasts

Closed Hopper Sand Blast

Have many features that make them superior.
For instance—Sand screened and Hopper filled at one operation.
LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.
HANDY THROTTLE CONTROL that saves time, air and sand.
WATER SEPARATOR that means fewer chokes due to damp sand.
CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.

GREATER CUTTING ACTION, due design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?

CHEAP AIR.

Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operating and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness) they operate earlier and require less attention than any other type.

Write us for Bulletin C-1 and Prices.

"ALWAYS DID" "AND WILL"

USE MAGNOLIA AND NO WONDER

Franklin, Mass., Sept. 18th, 1911.

Gentlemen:—

I have a stock of your metal on hand, always did and will as long as I find it satisfactory as I always did.

I have used your metal on a very hard drive of shafting, and I find that it is the only metal that will keep this shaft running cool. This bearing is running now five or six years with your metal. I also used your metal on a high-speed blower that used to trouble a lot, but now that your metal is running in blower, there is no trouble. This is four years ago. Your metal is also used on a short quarter turn drive; those turns used to be iron bushings. Of course they kept me in trouble for a long time, but now that your metal is in use instead of iron, there is no trouble whatever. This is about three or four years ago. All troublesome bearings that I have had in this mill are well known to Magnolia Metal. They are doing fine.

I am

Yours, etc.,

Adrien Cote, M.M.,

Ray Mills.

"No more repair bills for that Roof"

Think of the money you could have saved if your buildings had been covered with a roofing that never had to be coated, graveled or repaired! You'll never have to spend a cent for coating or repairs if you use

J-M ASBESTOS ROOFING

It is the cheapest-per-year roofing on the market.

J-M Asbestos Roofing is mineral throughout—layer upon layer of pure Asbestos (rock) fibres everlastingly cemented together with Trinidad Lake Asphalt—literally a sheet of pliable stone. Contains no perishable substance. Has been in service on hundreds of buildings for over a quarter-century and is sound to-day.

Keeps buildings cool in summer, warm in winter, and affords perfect fire protection.

Anyone can apply it. Don't take a substitute. J-M Roofing Cleats, packed in each roll, make absolutely watertight laps and give the entire roof a handsome white appearance. Our nearest Branch will ship direct if your dealer can't supply you.

We are also prepared to furnish J-M Regal Roofing, which, although low in price, is the highest grade rubber roofing on the market.

YALE

Triplex Block

"From Hook to Hook a Line of Steel"

When you buy a Yale Triplex Block, you are getting nearly double the value for the same money.

The Yale Triplex Block is rated on the basis of the long ton, 2,240 lbs. to the ton. Each rated ton is tested with a 50 per cent. overload, or 3,360 lbs. This rating gives you excess capacity in every Yale Triplex Block you buy. It is much stronger than any other Block made.

The buying of a hoist is important. The user cannot afford to make a mistake. The preservation of life and property depends upon it. The careless man buys first. The careful man gets his facts, then buys on his judgment. He does not rely on another man's judgment. The man who buys haphazard, or only on price, is more apt to be wrong than right. It is costly experience to be wrong in buying a Hoist.

The Yale Triplex Block stands ready to prove its safety, economy, and easy-lifting qualities in any kind of hoisting.

When you buy a Yale Triplex Block, a duplicate part can be secured in a hurry from the larger cities in all parts of the world. You do not have to wait for the factory.

This Block is good enough to bear the name Yale, known throughout the world for over half a century as indicating the best in locks and hardware. This name is on every important part. Look for the name YALE on your Block and the parts which you order for it.

"Safety First" Campaign--Canadian Car and Foundry Co.

Staff Article

An encouraging sign of progress is seen in the lively interest now being evinced in the "Safety First" movement by our leading industrial corporations and railways. No movement initiated during the past few years has made more rapid progress; this is clearly indicated by the diminution in the number of serious accidents. The following account of what our largest car building company is doing to promote the safety of its employees will doubtless be read with interest.

THOUGH of comparatively recent growth, it is clear that the "Safety First" movement has come to stay, and whether looked at from the humanitarian or from the strictly utilitarian point of view, it is equally to be commended. It is a movement that can be just as well installed in a small shop as in a large manufacturing plant, and the returns to be obtained from it, both in the saving of life and limb and also in the elimination of compensation payments, will more than justify the initial outlay required to adequately fence in dangerous machinery and otherwise protect workmen from accidents, whether due to their own carelessness or not. The word "carelessness" is used advisedly, for there is no gainsaying the fact that a large percentage of industrial accidents are directly attributable to want of ordinary caution on the part of the persons injured. To save himself a walk of 100 feet or so round the end of a string of standing freight cars, which may be blocking a track he has to cross, a man will often climb between two of the cars. Ninety-nine times out of one hundred no mishap results, but the one-hundredth time the yard switch engine backs up just as he is climbing over the couplers; he is thrown down, and perhaps loses an arm or a leg. Employers of labor can do little or nothing to prevent accidents of this kind beyond the display of conspicuous warning notices. In fact, the whole success of the Safety First movement depends almost entirely on the co-operation of the men; hence the importance of an aggressive educational campaign on the part of employers.

This educational feature is one to which the Canadian Car and Foundry Company are paying close attention in connection with the Safety First movement which they inaugurated a few months ago. In December last a general committee was organized at the head office in Montreal, and plans for an aggressive Safety First campaign were then formulated. The scheme is being carried out along the same lines in all the plants of the Canadian Car and Foundry Co., and also in those of the allied concerns, Canadian Steel Foundries, Ltd., and Pratt & Letchworth, Ltd.

FIG. 1. BOARD FOR DISPLAY OF "SAFETY FIRST" BULLETINS.

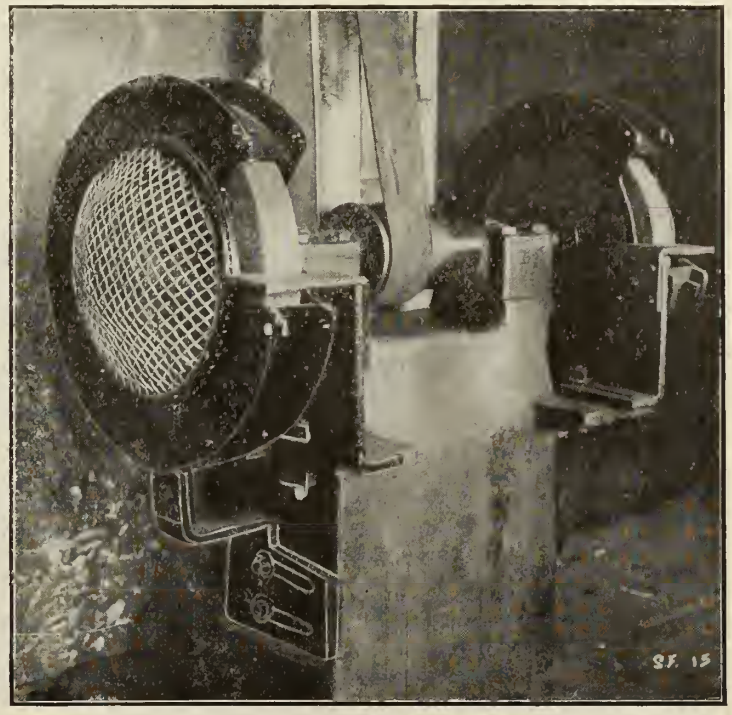

FIG. 2. EMERY WHEEL GUARD MADE UP FROM CHANNEL IRON AND STEEL PLATE.

Organization.

Each plant has a local Safety First committee of from three to five members, inclusive of the superintendent. This local committee investigates every accident occurring in its own plant, and reports thereon to the general committee, accompanying its report, if possible, by a recommendation of some nature for preventing a recurrence of such an accident. The members of the local committee are always on the lookout for means of improving existing safeguards, and welcome suggestions along these lines for men in the shops.

The general committee meets about once a month at each of the plants in rotation. It considers the reports sent in by the local committees, and if the suggestions contained therein be approved, they are embodied in a "Safety Bulletin" and distributed to all the plants. In this way caution signs, safety appliances, etc., are standardized, it being compulsory on each plant to closely follow out the instructions contained in every bulletin issued, so far as can be done without interfering with the operation of the plant. Copies of each new

bulletin issued are forwarded to the superintendents of the various plants, and are by them distributed to members of the local committee, foremen and others. Copies are also displayed on a large bulletin board at the entrance to the works, see Fig. 1. These boards form one of the principal means adopted for educating the men in the importance of the Safety First idea. Upon the boards are affixed cartoons and other illustrations showing how serious accidents have happened and how they might have been avoided. For instance, one cartoon shows a man chipping a casting. Across the shop another man is seen similarly employed. Neither man is wearing the goggles provided for use, failing thereby to realize that he is exposing others besides himself to chances of injury. Suddenly each of the two men is struck in the eye by a chip from the other man's chisel.

These illustrations are changed at frequent intervals, and there is always a crowd round the board whenever a new set is displayed—an encouraging sign of the interest evinced by the men. The company also publish a little monthly welfare magazine, a copy of which is delivered free to every employee. One section of this magazine is devoted entirely to Safety First news, and the principal safety bulletins issued by the general committee are published there from time to time.

After each monthly meeting the general committee makes a visit of inspection through the plant at which the meeting has been held, and inspects the work of the local committee to see that they are following out the instructions contained in the Safety Bulletins. There is a healthy rivalry between the various plants as to which shall have its machinery most efficiently guarded, though the appliances are becoming so rapidly standardized that there will soon be little to choose between them. In addition to looking after Safety First, the committee devises methods for improving sanitation, preventing fire, etc., and might aptly be called a "general welfare committee."

FIG. 3. TYPE OF BOX USED FOR COVERING STARTING SWITCHES, ETC.

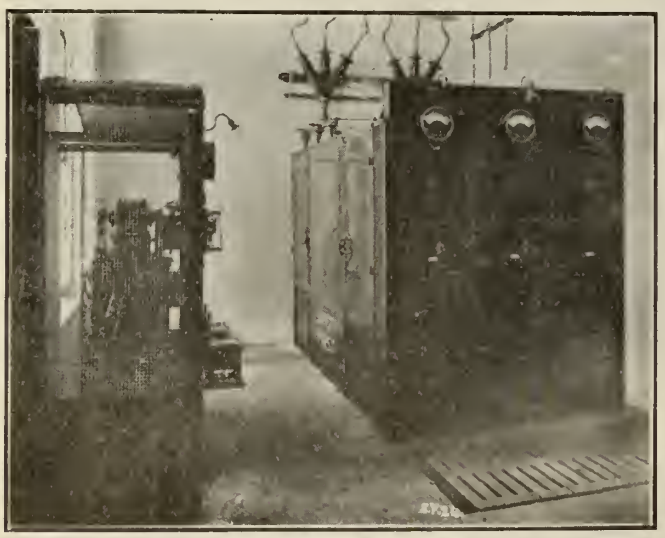

FIG. 4. SHAPER WITH STARTING SWITCH EXPOSED.

Methods Adopted.

Above the entrance to each shop is painted the name of that particular department, and underneath it the words "Safety First," thus:

TRUCK SHOP.
SAFETY FIRST.

Signs reading "Look out for Cars" are placed at corners near railroad tracks, and the "Safety First" slogan is displayed at every advantageous point. For instance, the cage of every overhead traveling crane in the shops is

FIGS. 5 AND 6. WIRE DOORS AND PARTITIONS IN TRANSFORMER HOUSE GUARDING EXPOSED HIGH VOLTAGE WIRES. THE WOOD SLAT FOOTBOARD HAS NO NAILS IN IT, WOODEN PEGS BEING USED INSTEAD.

painted white, and has the motto stenciled on it in large black letters.

Men are employed at each plant to go round the yards and shops looking out for projecting nails or anything else that might cause an injury. Many a man has stepped on a rusty nail and suffered serious blood-poisoning afterwards on account of having neglected what seemed at first to be merely a trifling wound.

The use of set screws has been abolished as much as possible, and steel plate, covers up the wheel very completely. To avoid all danger of a man's overalls or coat getting caught by the nut on the end of the spindle, the latter is covered in by a wire screen, as shown. Men operating these grinders are provided with light, comfortable goggles, and also with aprons made of two pieces of sole leather riveted together with steel brads. These aprons protect the abdomen from the vibration of the wheel. As the wheel wears down, where their use is absolutely necessary they are of the hollow or countersunk type, or else are placed in safety collars having flanges high enough to afford efficient protection.

In Fig. 2 is seen an excellent emery wheel guard in use at the Dominion plant, Montreal. This, made up from a small channel iron with sides of ¼-inch the guard can be set back by means of the elongated holes in the bracket supporting it. Although this guard has proved very efficient, it is understood that the Safety First committee are now working out an even better design in cast steel.

Fig. 3. shows a type of box, lined with non-combustible insulating material, which is used to cover all switches, fuses, circuit breakers or other electrical parts exposed to weather, dampness, or contact with inflammable material, or where employees are liable to make accidental contact with live parts. The latter accident would be very liable to happen in the case of the shaper seen in Fig. 4, if the switch were left exposed. At the Longue Pointe plant of the Canadian Steel Foundries, Ltd., a small refinement has been added to this switch box in the shape of a small hasp and padlock. Two keys for the latter are provided, one being carried by the superintendent and the other by the head electrician. This prevents any unauthorized person from replacing a blown fuse or tampering with the switch in any way.

Figs. 5 and 6 show wire doors and partitions guarding exposed high voltage

FIG. 7. SHOWING OPERATOR PLANING SHORT NARROW STOCK ON BUZZ PLANER WITHOUT USING SAFETY APPLIANCES. IT IS AN EASY MATTER TO LOSE ONE OR MORE FINGERS THIS WAY.

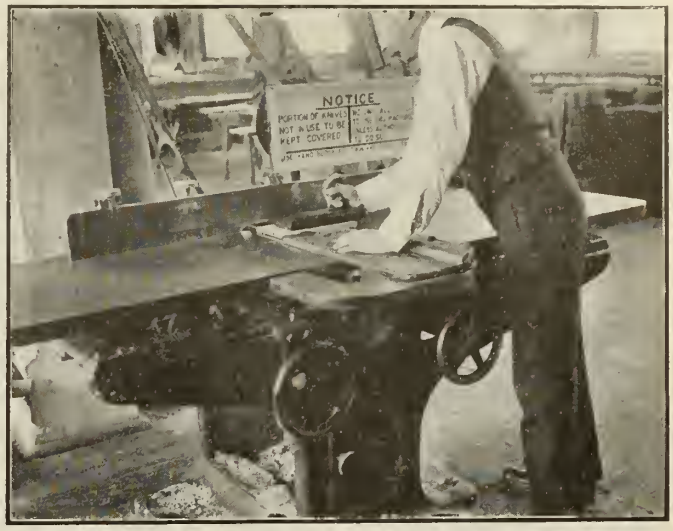

FIG. 8. HOW SHORT STOCK SHOULD BE PLANED. A HEAVY GUARD COVERS THAT PART OF THE KNIVES NOT REQUIRED, AND STOCK IS PUSHED FORWARD BY A WOODEN BLOCK FITTED WITH CONVENIENT HANDLE.

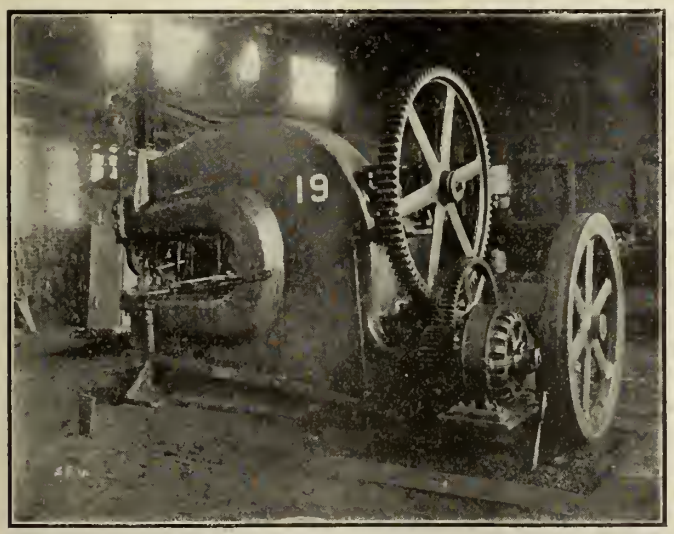

FIG. 9. MOTOR-DRIVEN PUNCH WITH FLYWHEEL AND GEARS EXPOSED.

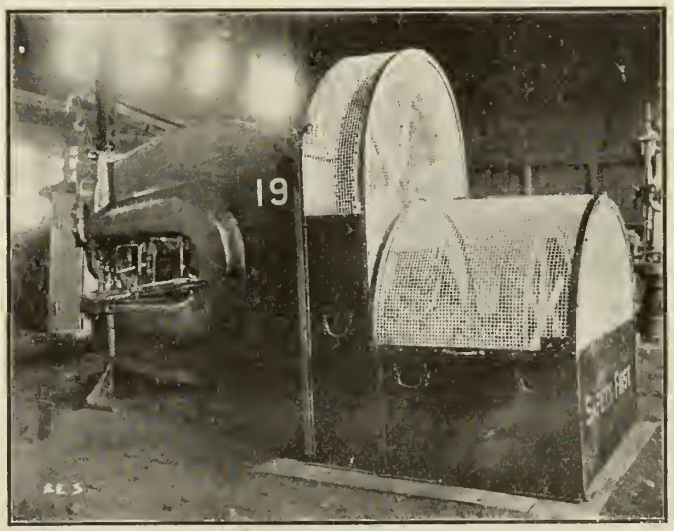

FIG. 10. THE SAME MACHINE FULLY PROTECTED, WHILE THE GUARD CAN BE READILY OPENED UP FOR OILING GEARS.

wires in a transformer house. One of the safety bulletins issued by the general committee calls for the use of rubber or wood slat mats in front of and behind every switchboard, and one of these wood slat foot-boards is seen in Fig. 5. It is made from pitch pine and is fastened together with wooden pegs in place of nails, to eliminate all possibility of shock to the operator.

FIG. 11. GEAR GUARD ON DOUBLE-ENDED PUNCH AND SHEAR.

Electricians are provided with painted signs reading "Under Repair," and have orders to display this sign in a conspicuous position on any crane or machine the electrical equipment of which may need attention.

Guarding Machinery.

Probably no machine in a planing mill is responsible for a greater number of lost fingers than the buzz planer, though the band saw perhaps runs it a close second. Fig. 7 shows a small piece of stock being planed in a buzz planer. The knives are exposed throughout their full length and the operator's right sleeve is actually touching the table and may easily be caught by the knives. Fig. 8 shows how the operation is performed in the shops of the Canadian Car & Foundry Co. An adjustable guard covers up that part of the knives not required and short, thin stock is pushed forward by a hand block somewhat similar in appearance to a hand plane. The notice board back of the machine reads:

> Portion of knives not in use to be kept covered. No one allowed to use this machine unless authorized to do so. Use hand block for thin and short stock.

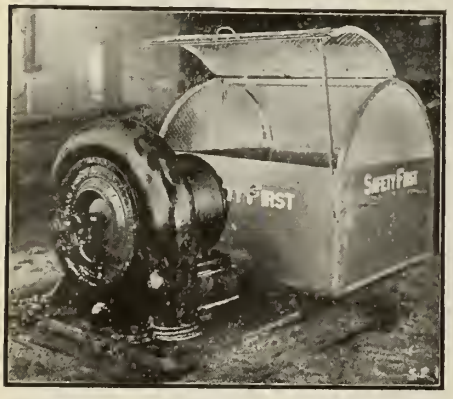

FIG. 12. COVER FOR MOTOR-DRIVEN FAN.

In Fig. 9, is seen a large punch with its motor, gears and flywheel dangerously exposed. Such machines as this usually have a pile of plates or angles near them, and it would be an easy matter for a man, in walking over these, to slip and fall with his hand in the gears.

Fig. 10 shows how this punch has been fenced in. The guard here seen is typical of most of those used throughout the company's plants for fencing machine tools. The lower part consists of $\frac{1}{8}$-inch plate, while the upper part is made from wire netting—$\frac{1}{8}$-in. wire with $\frac{1}{2}$-in. mesh. The corners and bottom edges are made with $1\frac{1}{4}$-inch angles, and the whole forms a neat, self-supporting guard, sufficiently heavy to retain its stiffness and appearance indefinitely. The netting is riveted, not bolted, to the angles. The rivets pass through the netting and are clinched on a 1 x 3-16 strap on the other side. The upper part of the guard covering the motor and flywheel is hinged at the top and provided with a prop to hold it up during the oiling of the gears—see Fig. 12. This type of guard could be made lighter if it were entirely of netting, but the solid lower half adds to the appearance, keeps dirt kicked up from the floor from entering the motor and gears, and greatly adds to the solidity of the whole.

From the neat appearance and high finish of the protective devices illustrated, the reader might infer that they are made up from carefully dimensioned blue prints sent out from the drafting office, but such is not the case. They are made up in the shop from measurements taken from the machine to be guarded. A few men were trained in this work in one of the largest of the plants and quickly became efficient. They were then distributed among the other plants to organize a gang of men in each, who give their whole time to this feature. As may be seen from the illustration, all guards are fitted with substantial handles by which they can be removed by three or four men, or by the shop crane, when repairs to the machine have to be effected.

FIG. 13. ENCLOSURE FOR A PRESSURE PUMP OPERATING AN HYDRAULIC PRESS. ALSO BELT GUARD.

FIG. 14. GUARD FOR ENCLOSING GEARS OF BOLT CUTTER OR SIMILAR MACHINE.

A neat casing for the pinion and gear of a large double-end punch is seen in

Fig. 11. Though the chances of getting a hand crushed here are practically negligible, it was thought advisable to install the guard and thus avoid the risk of a man's striking his head against the teeth of the large gear after stooping to the floor to pick up some object. This guard is hung by two iron straps from the top housing of the punch and is held at the bottom by a stud and light bracket. It is of course, made in halves.

Fig. 12 is introduced merely to show the general style of construction of these guards. This example is used to cover the motor-driven fan seen in the foreground.

Fig. 13 shows an inclosure for a hydraulic pressure pump. A door fitted with a pad-lock allows authorized persons access to the pump. This pump stands out some distance from the main shaft; hence the driving belt makes an acute angle and that part of it which would be liable to cause an accident has been guarded as shown.

Fig. 14 shows a modification of the same type of guard, suitable for protecting the back end of a bolt cutter or similar machine. It rarely happens that the same guard is suitable for more than one machine in the shop, and careful measurements are taken and a new guard made for each different unit.

Fig. 15 shows one of the guards applied to a high-speed hack-saw machine. It not only fully incloses the crank and driving pulley, but is carried up sufficiently high to prevent any possibility of a passer-by coming in contact with the belt.

A motor-driven hydraulic wheel press is shown in Fig. 16, and the same press with motor and gears fully inclosed in Fig. 17. This cover has a very neat appearance, but is to be superseded by one having panels of wire netting to ventilate the motor and allow inspection of the gears. On all wheel presses a safety bulletin is conspicuously placed, reading as follows:

SAFETY FIRST.

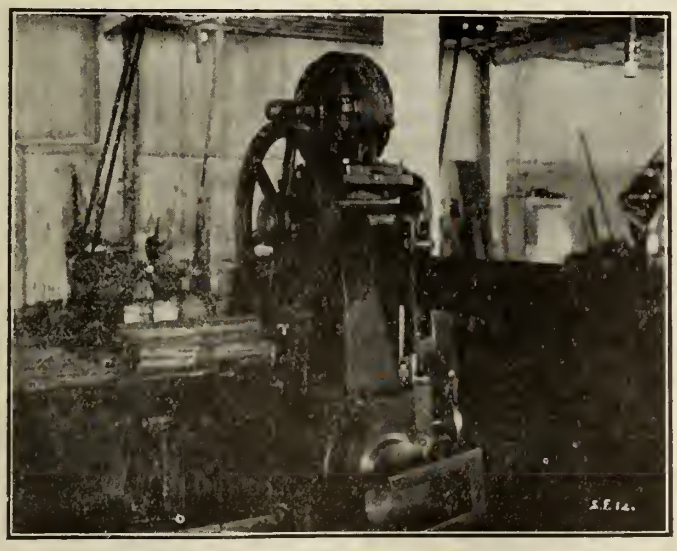
A loose wheel may result in serious injuries and great damage. A man to be fit for this job must never take any chances of a loose wheel getting into service.

FIG. 15. GUARD FOR HACK-SAW MACHINE.

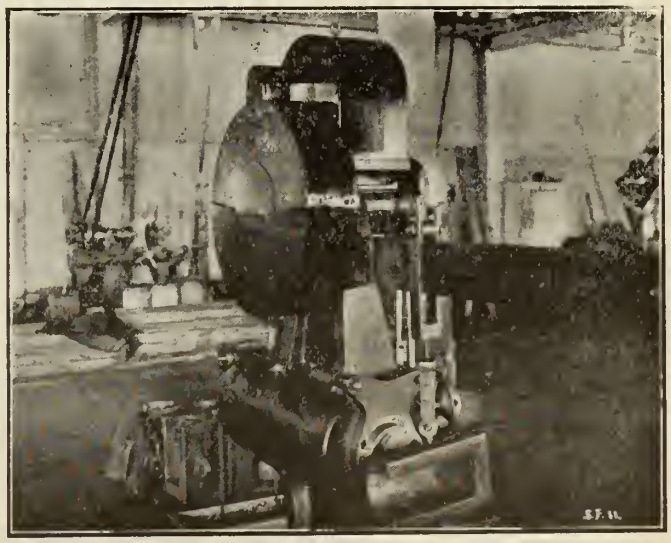
Though the illustrations accompanying this article deal principally with the guarding of machinery, it must not be inferred that the general and local committees devote most of their attention to this part of the Safety First movement. A great deal of time is spent in devising new rules or improving old ones, regulating the conduct of crane men, electricians, switching crews, grinders, yard laborers, etc. Up to the time of writing, about twenty safety bulletins have been issued, dealing with as many different subjects.

Personnel of General Committee.

The general committee, to whom is due a large share of the credit for the success which the movement has already achieved, consists of the following members:



W. S. Atwood, chairman.
L. H. Curry, vice-chairman.
F. A. Skelton,
C. J. Mahoney, secretary.



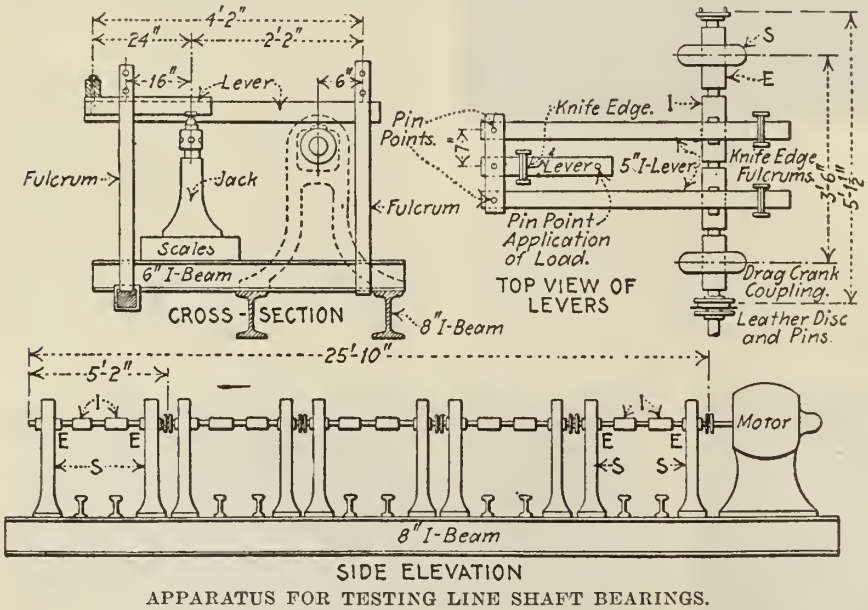
The superintendent, or manager, of each plant is also a member of the general committee, as are, ex-officio, all executive officers of the various companies.

Ambulance Work.

In spite of every precaution accidents will happen. Consequently, although the subject is not directly connected with the "Safety First" movement, a brief account of the ambulance work carried on by the Canadian Car & Foundry Co. and the affiliated companies may not be without interest.

A fully qualified medical man devotes his whole time to looking after the health of the companies' employees. To do this he has assistants at the Longue Pointe, Amherst, Brantford and Welland plants. At each of the works there is a well-equipped hospital, where minor injuries are treated by the doctor, or in his absence by a qualified first-aid man. The doctor visits each plant at a certain hour every day and men who have met with injuries, if able to get about, can call at the works hospital and get treatment every day until able to resume work. If their injury confines them to bed, the doctor visits them in their homes, no charge being made for the service in either case. An excellent rule in force at all the plants compels every employee receiving an injury, however slight, to visit the works hospital at once.

FIGS. 16 AND 17. SHEET METAL COVERS FOR MOTOR AND GEARS OF HYDRAULIC WHEEL PRESS.



Comparative Tests of Three Types of Line Shaft Bearings

By C. C. Thomas, E. R. Maurer and L. E. A. Kelso.*

This paper, read before the A.S.M.E. and published here in abstract, covers experiments made to determine the absolute and relative amounts of power required to drive a series of uniformly loaded and flexibly connected shafts supported successively by three different types of bearings.

THE tests from which tbe accompanying data is derived extended over a period of four years, and were finally repeated and all results cbecked by a set of skilled observers, wbo had formerly no connection with the work. Twenty ring-oiled babbitt bearings supported successively a series of uniformly loaded and flexibly connected shafts, a wide range of loads and speeds being covered and co-officients of friction worked out for eacb type.

The apparatus was designed and built in the department of steam and gas engineering at the University of Wisconsin, in collaboration witb the manufacturers of the bearings, and was so arranged that very exact measurements of power were attainable. All questions of possible lack of alignment, non-uniformity of loading, temperature and quality of lubricant, etc., were given careful study, resulting in tbe special form of apparatus used.

SIDE ELEVATION

APPARATUS FOR TESTING LINE SHAFT BEARINGS.

Description of Apparatus.

The apparatus consisted of 25 ft. 10 ins. of line shafting in five equal sections, mounted in bangers (S), whicb were inverted and used as floor stands, Fig. 1. The hangers were bolted to two 8-in. I-beams. The shafts were of cold rolled steel, 2 7/16 in. in diameter, each section being 5 ft. 2 ins. long. The adjacent sections were coupled together by means of a flexible leatber disk or two straps connecting the two flange couplings. The flexible couplings prevented tbe transmission of any part of tbe load applied on one shaft to either adjoining section, and also prevented binding between shafts and bearings due to possible lack of alignment.

A direct-current Fort Wayne motor was directly connected to one end of the shafting by means of a flexible coupling. The motor was of the interpole type with the interpoles removed, making it a shunt motor. A water rheostat was used in the field circuit to maintain a constant field, and another water rheostat was used in the armature circuit to vary the speed by varying the impressed voltage. The lost power was obtained first by taking tbe armature resistance for various currents and plotting a resistance, armature-current curve. From this curve was plotted an armature-I^2R loss, armature-current curve. From this the armature resistance loss for any armature current was obtained. The stray-power loss was obtained by taking a stray-power loss field current curve for each speed; then for any speed the loss for tbat speed and field could be obtained. By use of this metbod, the power required to run the motor alone at all speeds, without load, was accurately ascertained, as well as tbe power required to run the motor and shafts togetber, at all loads and speeds. The relative amounts of power required to overcome the friction of the various types of bearings were, therefore, accurately determined.

Application of Load.

Tbe load was applied tbrough levers upon bardened knife edges and pin points as fulcrums. Across tbe top of the 8-in. I-beams and at right angles to them were bolted short 6-in. I-beams to which tbe fulcrums were attacbed. The loads were applied to tbe shaft by two bearings between each pair of bangers. Tbese bearings were identical witb tbose in the hangers, and were supplied with knife edges whicb engaged a V-shaped groove in tbe 5-in. I-beam levers. The bearings and bangers for eacb section were symmetrically placed witb respect to the middle of the section; tberefore, equal loads on the intermediate bearings (I) produced equal pressures on tbe end bearings (E). Tbese latter pressures exceeded those on the intermediate bearings by one-half the weight of the shaft, or by 40 lb. Tbis difference is regarded as negligible in the paper, and load per bearing means average of the loads on intermediate and end bearings. Tbe bearings were prevented from turning by sbort levers fastened to tbem and resting upon uprights from tbe floor. Only one type of bearing was tested at a time, so tbat no complications migbt arise in establishing the losses for the particular form under test. The reason for using 20 bearings was tbat the amount of power necessary for a single bearing was so small as to be difficult of exact measurement. Also any single bearing might not as truly represent results from that type of bearing in general as several bearings taken togetber.

The Bearings Feature.

The three kinds of bearings tested were:—The ring-oiled bearing, manufactured by The Dodge Mfg. Co., lined with babbitt metal made from tbeir formulae; the Hyatt roller bearing, manufactured by the Hyatt Roller Bearing Co.; and tbe Hess-Bright ball bearing, manufactured by tbe Hess-Bright Mfg. Co. All bearings were for the same size shaft, and, in fact, the same pieces of sbafting were used for all the tests, except that two sections wbich bent during the tests were replaced.

*Professor of Mechanical Engineering, Johns Hopkins University; Professor of Mechanics, University of Wisconsin, and Instructor in Electrical Engineering, University of Wisconsin, respectively.

The babbitt bearings were 9 21/32 in. long, and hence their projected area was 22.36 sq. in. The following table is appended for converting total loads used in the tests into unit loads:—

730 1230 1730 2230 lb. per bearing
33 55 78 100 lb. per sq. in.

These bearings were oiled by the well-known ring-oiler device, two rings in each bearing.

Each roller bearing contained six right-hand and six left-hand rollers, .78 ins. in diameter; six being 9 9/16 ins. long, and six being 9 3/16 ins. long. They were of the type in which a cage is used for holding one-half the rollers. Each ball bearing contained a single set of balls, 9/16 ins. in diameter, while the diameter of the inner race through the ball groove was 3.4729 inches. The power was measured by the ammeter voltmeter method, while mercury thermometers (two in each babbitt and roller bearings and one in each ball bearing) were used for measuring the temperature of the oil or bearing.

The speeds used in the tests were between 150 and 450 r.p.m., corresponding respectively to about 100 and 300 ft. per minute peripheral speed. Most of the loads used were between 700 and 1800 lb. per bearing, corresponding respectively to about 30 and 80 lb. per sq. in. for babbitt bearings. All statements of results, therefore, are subject to the above limitations as to speed and loads.

Two lubricants were used in all the tests—Atlantic red engine oil in the babbitt and roller bearings, and No. 2 Keystone grease in the ball bearings.

Results of Tests.

For all conditions of load and speed the power decreased with increase of temperature, but the rate of decrease at the highest load and speed was more marked in the case of the babbitt bearings. At the lower speeds the power did not vary at all with the temperature, practically speaking.

of bearings at the speeds and temperatures indicated. The relative numbers are based in each case on the average power for three loads: 710, 1210, and 1710 lb. for balls; 740, 1240, and 1740 for rollers; and 730, 1230 and 1730 for babbitt.

Breakdown Tests.

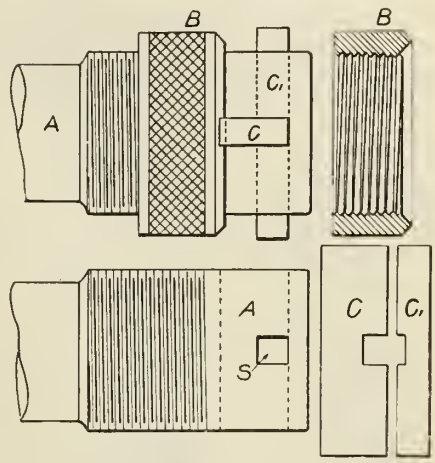
In order to observe the performance of the bearings under extraordinarily heavy loads, breakdown tests were run on each type of bearing with only one section of shafting, on which were four bearings. This small number of bearings was used because it was impracticable to keep close watch of a larger number of bearings and avoid trouble during the excessively severe conditions. The maximum load was 600 lb. on the scales, or about 5000 lb. per bearing.

The speed of 200 r.p.m. was chosen because it represents about the average lineshaft speed in practice. These tests began at about 3200 lb. per bearing. Failure occurred at about 4250 lb. per bearing in the case of the babbitt, 4650 lb. in the case of the ball bearings, and about 5100 lb. in the case of the roller bearings. The quality and amount of lubricant used undoubtedly have an important effect upon the load that will cause a given bearing to fail.

The bearings did not in any case "fail" structurally, as the power was cut off soon after distress was manifested, but the failure was simply that of the lubricant. Breaking down of the lubricant results in an immediate increase of the power required to maintain the original speed of rotation of the shaft in the bearings. In each case probably only one of the four bearings used in the breakdown tests showed distress at any one time. In the case of ball bearings, this was evident, as distress was manifested by disintegration of the grease which "melted" and ran out of the bearing. This was accompanied by an immediate increase in

Table 1.—Relative Amounts of Power Consumed in Friction.

Bearings.	100 Ft. Per Min. 77 Deg.	100 Ft. Per Min. 100 Deg.	300 Ft. Per Min. 77 Deg.	300 Ft. Per Min. 100 Deg.
Ball	1	1	1	1
Roller	2.2	2.5	2.7	3
Babbitt	3	3.6	4.5	4



In a comparison of the babbitt, roller and ball bearings for 100 degs. and 77 degs. temperature, it was shown that the power for the babbitt is higher than for the other bearings except perhaps at low loads and speed, and that the power for rollers is higher than for balls. The excess of power for babbitt over rollers and rollers over balls increases with increase of speed for all loads. Table 1 shows the relative amounts of power consumed in friction by the three kinds

power requirement. The temperatures given (99 deg.-117 deg., etc.) indicate the averages for the four bearings being tested. Similar behavior on the part of the babbitt and the roller bearings indicated that at least one of the four under test was suffering from an approach to "metal-to-metal" contact. The bearings were not injured by these endurance tests, and all were used in subsequent tests at the more usual speeds and pressures.

SELF-SETTING CUTTER BAR.

By H. Womersley.

THE accompanying figure shows a self-setting cutter holder which has the advantage of carrying a number of cutting tools that can be quickly changed for a set of a different size. The cutters (C) and (C_1) are made to fit each other at right angles as shown. Slots to receive them are cut in the bar (A) which is also threaded to take the knurled nut (B).

SELF-SETTING CUTTER BAR.

The cutters are located by the slots in the bar and also by the V-shaped edge of the clamping nut fitting into corresponding Vees in the large cutter. The cutters are finish-turned and ground while in the bar, and marked so that they will always true up when the nut (B) is tightened upon them.

Improved Tungsten Lamps.—The arc lamp is evidently to be superseded shortly by a greatly improved tungsten filament incandescent lamp. Instead of attempting to work the filament in a perfect vacuum, the globe, after exhausting, is refilled with pure nitrogen at atmospheric pressure. This allows the filament to be operated at a much higher temperature than is possible with the vacuum without injury to and blackening of the globe. The efficiency of the lamp increases very rapidly at these high temperatures and, in the experiments thus far tried, a candle power has been obtained per .5 watt as compared with 1.25 watts per candle of the ordinary tungsten lamp. This type of lamp has been found to be best suited for powers of from 1,000 to 6,000 c.p., but it is claimed that all tungsten lamps will give much better service with nitrogen than with a vacuum.

Vancouver, B.C.—The General Fire Extinguisher Co. is considering erecting a large factory here.

Safety Provisions Relative to Transmission Machinery—II.

By W. Sydney Smith.

An official report by the Inspector for Dangerous Trades in England, regarding fencing and safety precautions for transmission machinery, has been issued. It explains the structural and administrative safeguards with regard to the several parts of transmission machinery which experience shows to be needed for the protection of persons employed where such machinery is used.

CONCERNING couplings, the report says that such projections as bolt heads, nuts, screws and keys should be prohibited in all new installations of

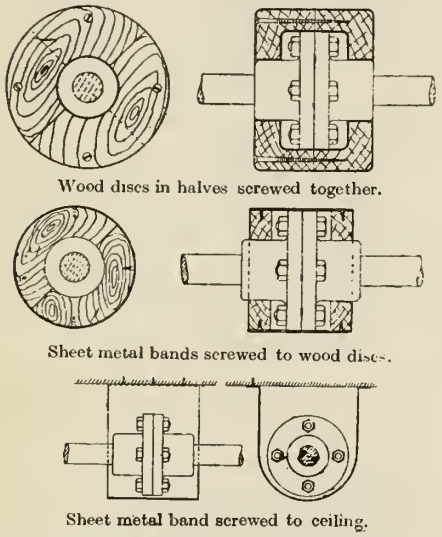


FIG. 6. FENCING FOR PROJECTING BOLTS OF SHAFT COUPLINGS.

transmission machinery. Shaft couplings should be constructed with countersunk bolts and nuts, shrouded flanges, or other equally safe devices. In existing installations, as shaft couplings are generally situated near bearings, all projections should be covered by smooth wood or metal casings if the shafting is ever approached whilst in motion. Various methods of fencing projecting coupling bolts as shown in Fig. 6.

Collars.

Projecting set-screws on shaft collars should be prohibited on all new installations. Countersunk set-screws or other equally safe method of attachment should be provided. On existing installations of transmission machinery, as collars are always situated in close proximity to bearings and loose pulleys, projecting set-screws should be removed, replaced by countersunk set-screws, or covered with a smooth cap or guard if the shafting is ever approached whilst in motion. Figs. 8 and 9 show types of guards.

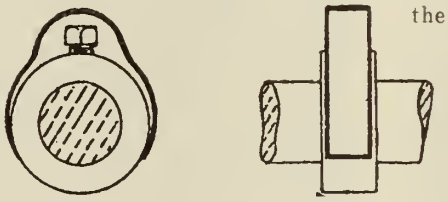

FIG. 8. STEEL CLIP GUARD FOR PROJECTING SET SCREW OF SHAFT COLLAR.

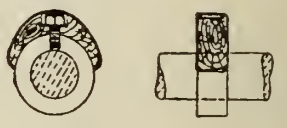

FIG. 9. WOOD GUARD FOR PROJECTING SET SCREW OF SHAFT COLLAR.

Wheels, Drums, Pulleys.

All appliances of this nature if less than 6½ ft. from the floor level or any place to which the workers have occasional access, should be fenced so securely as to prevent accidental contact by persons with parts in motion, but appointed persons, such as enginemen, oilers, and beltmen, may be allowed to approach unfenced drums and pulleys for the necessary work of manipulating driving belts and ropes at times when the speed of the shafting and pulleys does not exceed 6 revolutions per minute if adequate provision is made for prompt stoppage of such parts at the first sign of danger. Gear wheels, if situated as above, should be encased with metal guards fully protecting the teeth and rims with a portion of the guard hinged or sliding to facilitate lubrication of the teeth.

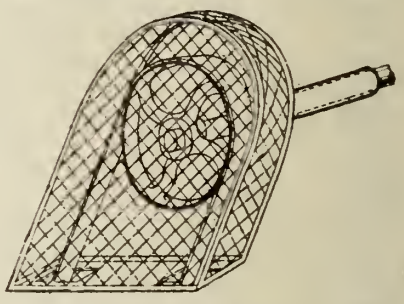

FIG. 10. WIRE NETTING GUARD FOR BELT AND PULLEY.

Partial guards for gear wheels are always inadequate, and may even be dangerous; though the ingathering teeth may be protected, additional points of danger are introduced between the teeth and the ends of the guard, and fingers, clothing, or cleaning rags may easily be caught unless the teeth are wholly covered. Complete guards, enclosing the whole of the wheels, have the advantage of preventing access of dust and also limit the splashing of grease. For these reasons gear wheels on overhead line shafting are generally completely fenced.

Sprocket wheels for chain drives should be fenced like gear wheels, if similarly accessible. Friction gearing is equally dangerous as toothed gearing at the intaking parts, but guard rails are generally sufficient for this type of transmission machinery if the fence be

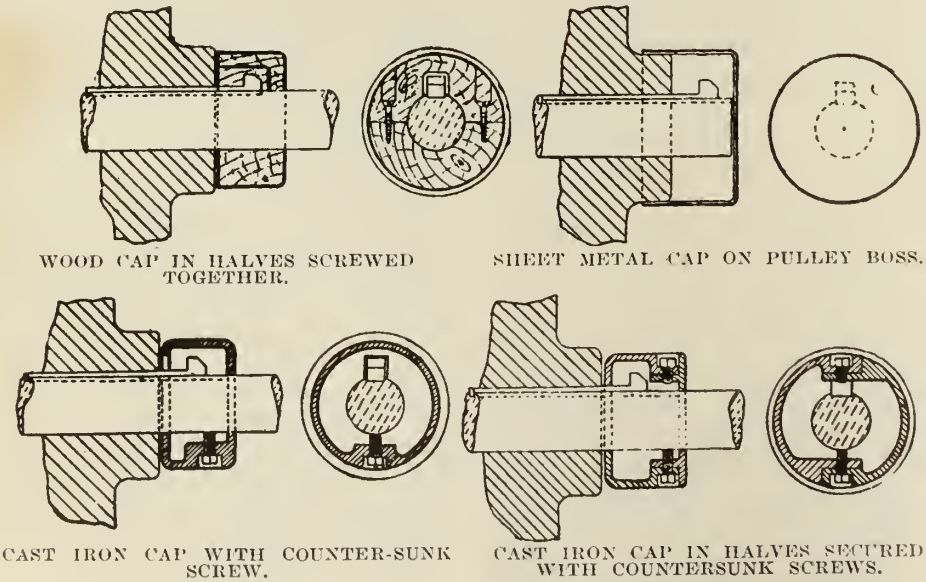

FIG. 7. GUARDS FOR PROJECTING KEY HEADS OF SHAFT COUPLINGS.

maintained in such position that the space between rails and dangerous parts cannot be entered by the workers.

The type of fencing for drums and pulleys is often determined by their position and the direction of the driving bands and ropes; the guards may generally be so arranged as to include fencing for both pulleys and bands, Fig. 10. Fast pulleys near the floor level are dangerous owing to the risk of clothing and feet becoming entangled between belt and pulley. These should be protected by guards, which should also fence the loose pulleys and driving belts. Fenders of wood or metal form satisfactory fences for pulleys in such positions. Guard rails are often so used; sheet metal, wire netting or perforated metal being added according to special circumstances where the pulleys are more exposed or greater danger exists owing to the employment of females.

Methods of Solving the Problem of Foundry Help

By Arthur Smith

The effects on the general efficiency of any particular body of foundry operatives which the allocation of the best work to one or two men, and the lack of consideration for apprentices brings about are, together with the "handy man" feature, discussed in a practical and telling manner in the following article.

IN a foundry the help question is often one of a serious nature, and many of the foremost foundry managers of to-day owe their success to the scientific solution of this problem.

Invariably the most skilled moulders congregate in or near large cities. The principal reason for this, besides the lure of city pleasures, no doubt is that labor organizations are more strongly intrenched in the larger centres, and the workman consequently commands a higher wage for his services. While the foundryman in the city may select his men from among the cream of the trade, his less fortunate brother in the smaller town must content himself with the help that filters through the sieve of the metropolitan foreman, or develop his help along lines peculiar to himself.

How often does one go into a shop on the outskirts and find that the best jobs are saved for one or two star moulders, while their fellow workmen look with envious eyes upon certain patterns that they are never allowed to place in the sand. During slack times no hardship is experienced from this method of working, but when business becomes brisk and customers demand castings on short notice, the foreman who has allowed his tedious work to repose in the hands of one or two skilled moulders is in a serious predicament. At such times the star moulders are inclined to become just a little bit conscious of their responsibility, and jobs, instead of moving faster, may go more slowly on account of more importance being attached by these experts to the doing of the work than to getting it out.

Training Apprentices.

The old adage: "In time of peace prepare for war," may be applied to advantage in foundry practice. The foreman who, in quiet times, instead of bemoaning his decreased tonnage, endeavors to so build up his organization that he may not be caught napping when the rush comes, earns ultimate success. There are several ways of accomplishing this. Some foremen resort to the method of developing a greater number of apprentices, when such are available; the training of whom is an art in itself. Many a bright boy, who would eventually become a first-class mechanic and a credit to the trade, is driven from the shop for some youthful prank, the foreman evidently expecting a boy of fifteen to have the dignity and poise of a man. Again, the boy may be placed with a man who is known to be crabbed and disagreeable, and the apprentice finds it impossible to satisfy him. The boy though ill-treated, fears to complain, and if complaint be made by the moulder, the lad is often sent packing without any effort being made to ascertain whether he is not more sinned against than sinning.

There are, alas, too many moulders who have evidently forgotten that they were once obliged to serve an apprenticeship. Instead of assisting a youth placed with them, they endeavor to keep his efforts strictly applied to manual labor. The apprentice's duties under these conditions, consist of shoveling, hunting gaggers, wheeling facing, etc., and when the mould is finally rammed, he must stand idly by while the moulder proceeds to finish the creation of his skill. The boy must not put a tool to the mould, though if his superior be more kindly disposed he may be allowed to rub on the lead. Is it any wonder that boys are often out of their time for several years before they acquire any finished skill in their chosen occupation.

A certain foundry manager in one of the largest shops in the United States has evolved a novel plan for training foundry apprentices that has been very successful. After an apprentice has been in the shop for about a year, he is given a floor and put strictly upon his own merits, with simple work. A short time later, an entirely green apprentice is taken in and placed with the boy having a year's experience. They work together for a while and as the older boy becomes more proficient he is graduated to another class and a second green boy brought in any placed with the one who has just been left alone. By this system the boys are being developed continuously, and by placing them upon their own resources at an early period of their apprenticeship, they become more self-reliant and eventually become skilled mechanics. Of course this manager draws some blanks. In fact the percentage of boys finally surviving the ordeal is relatively small, but, after all, results count.

Developing Unskilled Labor.

It often happens in these strenuous times that foundry apprentices are very rare. The textile mills, garages, machine shops, etc., claim many of them, and, in fact, the foundry seems one of the least desirable of the many openings for young men. To offset this, foundrymen are turning their thoughts to the development of "handy men," and it is remarkable what success is being achieved along these lines. There are in nearly every foundry, certain laborers who, either through lack of opportunity or neglect have not in their boyhood days acquired a trade. They have now passed their early youth and look grimly into a sordid future at laborer's wages. This class of men respond readily to the foundryman who is endeavoring to develop moulders by rapid stages. It is true that these men rarely become the most skilful in the shop, though there are cases where they rank among the best, and for certain lines of work they are unexcelled.

The usual method of development is as follows: A bright laborer is placed with a moulder, preferably a friend or relative if possible, and given every opportunity of showing any ability he may possess. Sometimes the process is very slow, and it may be a year before the laborer is capable of assuming any responsibility, but eventually he finds himself.

The man, if at all human, appreciates what has been done for him, and remains faithful to the one who has given him his chance. The foreman does not fear of his leaving to accept another job, for, while he is a valuable man where he is, his qualifications are not so general that he would be sought for by a rival foundry.

A FEW USEFUL DRILL JIGS.

By W. G.

THE jigs herewith illustrated are of very simple construction, and are especially intended for use in cases where the number of components to be machined is small and the question of outlay is to be considered.

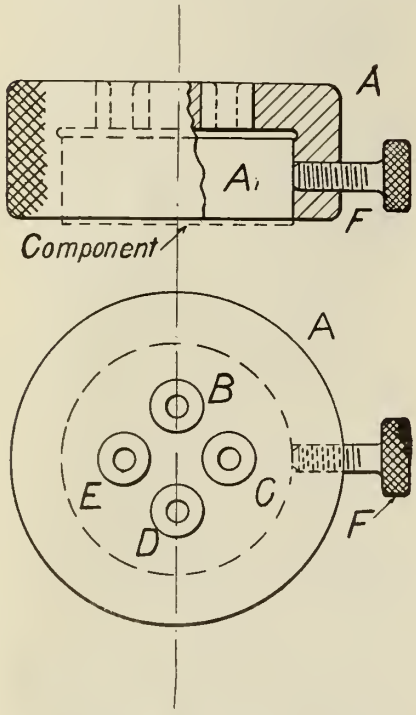

FIG. 1. JIG FOR SCREWING DIES.

Fig. 1 is part sectional elevation and plan of a simple form of plate jig for drilling the clearance holes in screwing dies (flat-circular). Part (A) is the body. This consists of a circular knurled mild steel blank, in the centre of which is formed a recess (A) for the purpose of receiving and locating the component. It is essential, however, that the said recess should be of such a depth as to allow the component to stand clear of the jig face, as shown; thus in each case the base of the component becomes the drilling face, and any injury to that of the jig will not in any way impair the results.

The upper part of the body is provided with four drill bushes (B), (C), (D) and (E). These should be of best cast steel, hardened and ground, and should be made a driving fit for the holes in the body. Part (F) is the clamping screw. This is preferably made from mild steel, and should be case hardened at the extreme end in order to prevent burring.

Fig. 2 is a front view and part sectional side view of a jig for drilling the "tommy" holes in circular adjusting nuts. The body (G) consists of a cast iron block of square section, in the face of which is formed a circular recess (G^1) for the purpose of locating the work. It is also provided at its opposite face with a clearance hole (G^2), the object of the latter being to facilitate the removal of chips, etc.

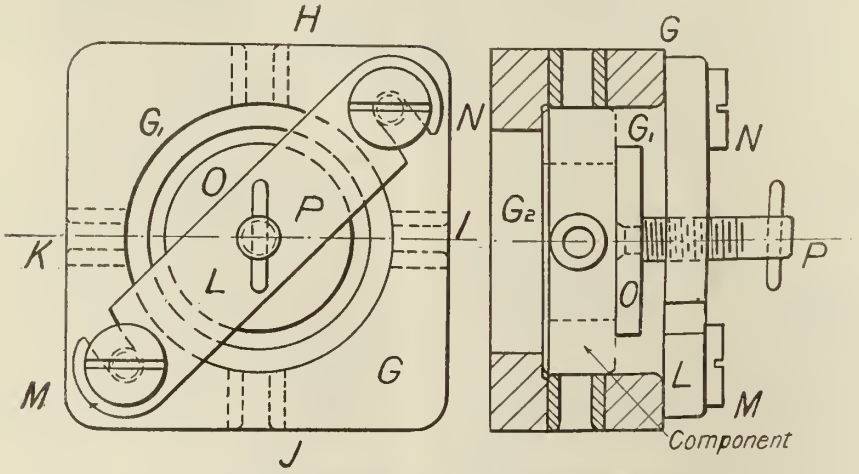

FIG. 2. JIG FOR DRILLING ADJUSTING NUTS.

Parts (H), (I), (J) and (K) are the drill bushes. These should be hardened and ground, and a tight fit to the holes in the jig body. The detachable latch (L) is preferably made from "black" (unmachined) mild steel, and does not require any machining beyond the cutting of the end slots and the drilling and tapping of the clamping screw hole. Parts (M) and (N) are the supporting pins for the aforesaid latch. Parts (O) and (P) are the clamping plate and screw respectively. The former is secured to the latter by riveting, as shown.

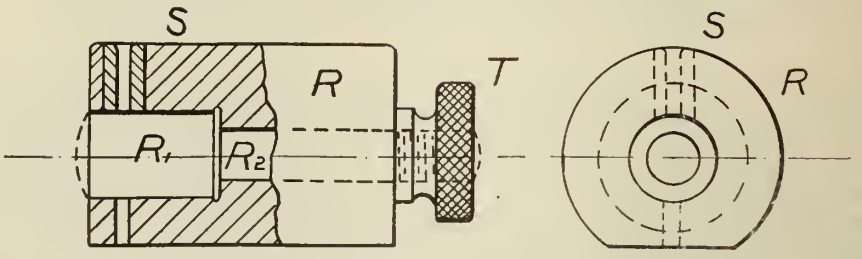

FIG. 3. PEG HOLE JIG.

The sequence of operations is as follows:—The component is first passed into the locating recess (G^1). The detachable latch (L) (carrying clamping plate and screw) is next secured to the cheese head pins (M) and (N). A turn of the clamping screw (P) finally secures component and latch in their respective positions for work.

Fig. 3 is part longitudinal section and end view of a peg hole jig for circular-headed set-pins. The body (R) is made from circular mild steel bar. It is advisable, however, that the whole of the machining (except flat and bush hole) should be performed at the same lathe setting. The hole (R^1) is the locating hole, and this should be bored quite true; the other (R^2) is simply for the purpose of clearance, and need only be drilled. Parts (S) and (T) are the drill bush and thumb nut respectively. The latter consists of the usual type of knurled thumb-nut tapped out of corresponding pitch to that of the component.

It will be noticed that the over-all length of the jig is less than that of the component, thus allowing sufficient overlap of the latter for the purpose of securing it to the jig body by means of the thumb-nut (T), as shown.

SOME SIMPLE BORING TOOLS.

By H. Womersley.

FIG. I. represents a cheap and very easily made boring head. It can be of any size desired and is very useful for the turret lathe. The body (B) can be

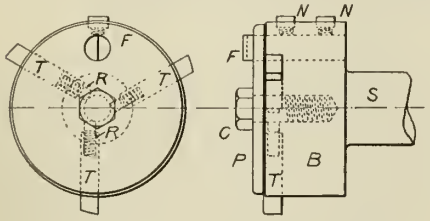

FIG. 1. BORING AND FACING TOOL.

of cast iron with slots planed in its face to take the three tools (T) which may be of high-grade steel. The tools are tapped at the back for set screws (R) as shown, for the purpose of adjustment; and all are securely held in place by the plate (P) and the cap screw (C). The placing of the cutter (F) shows how this head can easily be arranged for facing. More of these may be inserted if desired. The cutters can be ground in the machine or with the help of a sliding gauge. This head is useful for finish boring rough holes where no great degree of refinement is required.

Finish Boring Head.

The boring head shown in Fig. 2 is one that can be made in a very short time

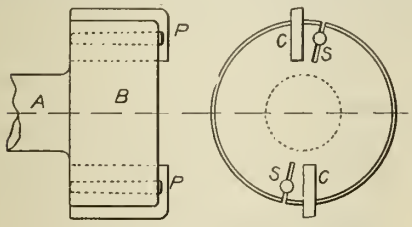

FIG. 2. FINISH BORING HEAD.

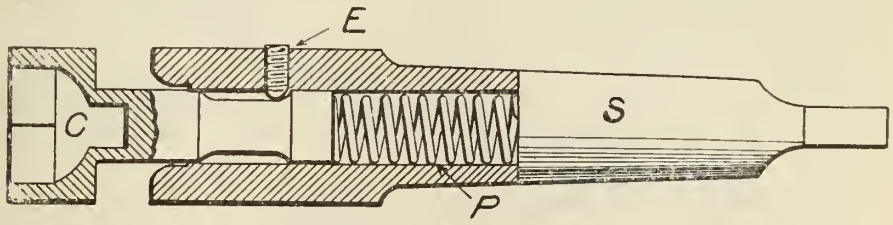
and with little expense. The body (B) and shank (A) are of machine steel to suit drill press, turret head or even the lathe tail stock. Holes are first drilled and taper reamed to take the standard taper pins (P) which hold the cutters (C) in place. These cutters can be ground with square corners or with any sized fillet as shown. This appliance is particularly useful as a cheap finishing tool for both boring and bottom facing.



NUT-RUNNING ATTACHMENT.

By Wm. Gibbs.

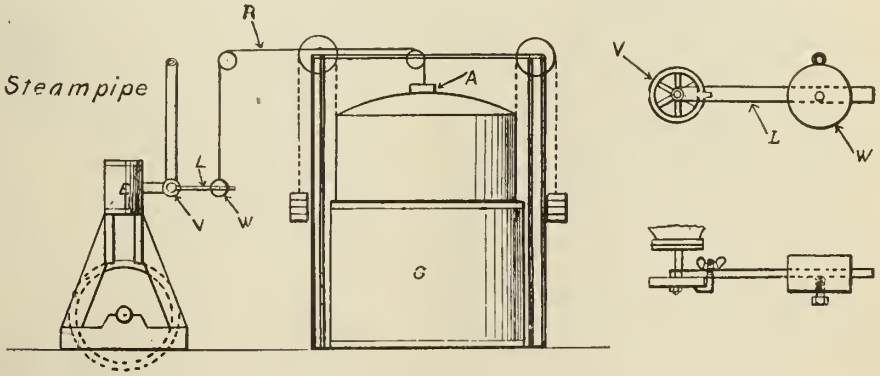
WHEN a piece of work requires the placing of a large number of bolts, the time consumed in screwing on the nuts often makes this the most expensive operation involved, and any means of eliminating more or less, this tedious operation is a welcome addition to the organization.

In the illustration is shown a self-releasing nut-runner of very simple design and very effective in operation. It consists of the Morse tapered shank (S) which is bored out to take the spring (P) and the nut chuck (C) which is free to slide in and out, but not to rotate in the shank. The socket (C) is made of tool steel and is hardened, while the shank may be of mild steel. The tool can be applied to different styles and sizes of nuts by simply backing off the set screw (E), removing the chuck and substituting the one desired.

The appliance complete may be driven by a suitable chuck attached to a flexible shaft, or for work not heavy or bulky, it can be set up in the drill press and the work moved under it. After starting the nut by hand, the socket (C) is placed

NUT RUNNING ATTACHMENT.

over it while in motion. When the nut is tightened down hard, the chuck rises up off it against the pressure of the spring and is ready to be applied to the next; the tightness to which the nut is screwed depending, of course, upon the tension of the spring. The above device has been in continuous use for a long time and is giving perfect satisfaction.



REGULATING DEVICE FOR GAS PRODUCERS.

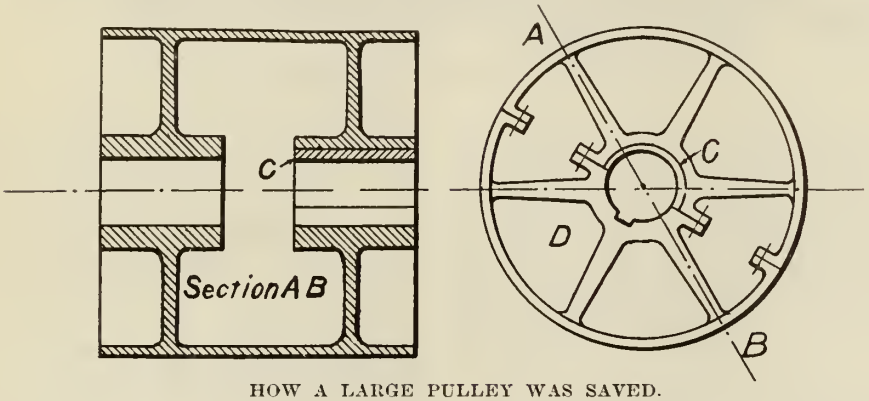
By R. Bell.

IN connection with gas plants using pressure producers, it is necessary to regulate the speed of the blowers by some means so that the producers supply approximately the amount of gas required by the engines. If this be not done automatically, a constant watch must be kept on the gasometer to prevent it getting too high or too low, especially when a fluctuating load is being carried. If the holder should rise too high, the gas will blow out beneath it and the dangerous nature of this poisonous gas in a building or closed space cannot be over-estimated. On the other hand, I have seen the top of a large gasometer crushed in by the suction of an engine when allowed to go down to the bottom. The accompanying sketch illustrates an extremely simple method of regulation which has been used with great success.

In the above arrangement of the gasometer and blower engine, a lever (L) is attached to the steam valve (V). This lever is connected through the flexible wire rope (R) to a weight (A) on the tank as shown. The counterweight (W) is lighter than (A) but is sufficient to overcome the friction of the valve spindle packing and keep the rope (R) tight. As the holder goes down with a heavy draft of gas, the lever (L) rises, opening the throttle and speeding up the blower engine. Likewise, if the holder rises, the steam is cut off and the blower slows down. The weight (A) is not fastened rigidly to the holder so that there is no danger of breaking the rope by an excessive fall of the gasometer, the weight (A) simply remaining suspended by the cord.

In the second half of the figure is shown the means of fastening the lever to the hand wheel. A hole is drilled in the end of the lever for the valve spindle and another to take the hook bolt clamp as shown. When starting up or slowing down the engine, the lever is disengaged by loosening the wing nut and opening

REGULATING DEVICE FOR GAS PRODUCERS.



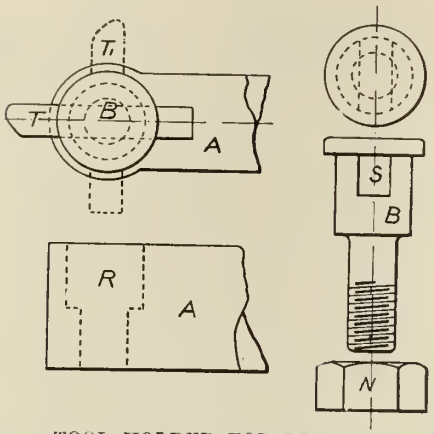
or closing the valve by hand. When the best working speed is attained, it is only necessary to tighten up the wing nut with the lever in the proper position.

HOW A LARGE PULLEY WAS SAVED.

By J. D. Y.

THE pulley referred to was 8 ft. in diameter, with a 4-ft. face, being intended for two 24-in. belts. It was made of cast iron in two sections bolted together, as shown in the sketch. All the machine work had been done except the boring of the hub, when it was discovered that the bore in one of the sections would not clean up.

To increase the bore and bush it was at first considered the only way out, when the thought occurred, why not bush the imperfect half only? This was done. Section (D) was moved out of the way, and the other half bored to take the half bushing, as shown. The bushing was fastened by four small pins, and the key-way cut in the solid half of the wheel. The pulley has been in operation for some considerable time now, and is giving complete satisfaction.



HOW A LARGE PULLEY WAS SAVED.

HEAVY ADJUSTABLE TOOL HOLDER.

By H. Womersley.

THE accompanying sketch is of a more or less common but very handy tool-holder for heavy work, and can be used either on the planer or lathe. It consists of the bar or shank (A), which may be of any size desired. It is jumped up on the end and drilled at (R) to take the clamping screw (B), shown. The clamping screw is slotted under the head at (S) to take a tool (T) of the desired size. The tool is slipped through the slot, and is held in place at any angle by tightening the nut (N).

For planer work this tool-holder is best used upside down, with the tool trailing, to prevent digging in, also the shank (A) usually has a number of grooves milled in its face to fit the tool and hold it firmly in its different positions.—Ed.

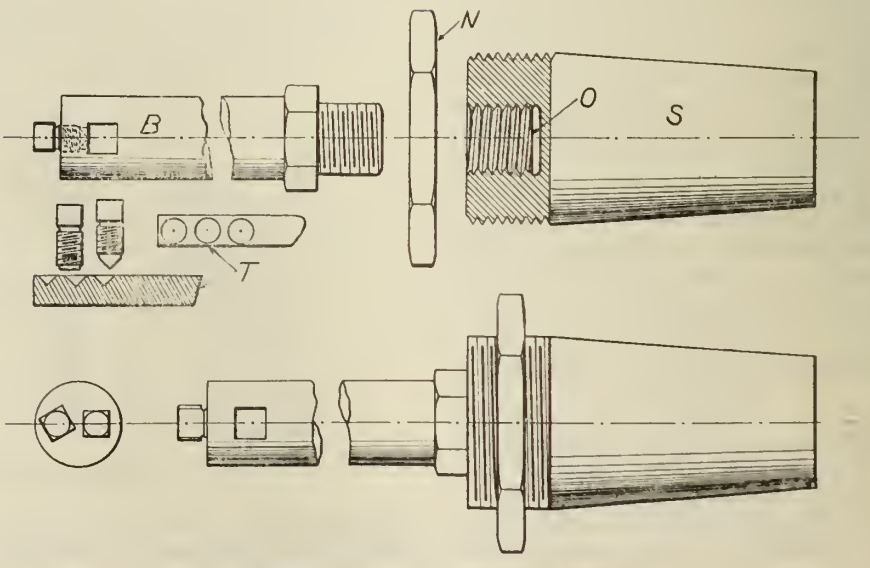
TOOL HOLDER FOR PLANER.

BORING BAR FOR MILLING MACHINE.

By Armley Leeds.

IN all kinds of jig making where there occurs the necessity of boring holes at exact centres, the milling machine fitted with a suitable boring bar is a primary requisite. A very suitable tool for this purpose is shown in the accompanying cut.

The arrangement consists of the shank (S) provided with the nut (N) for the purpose of withdrawing it from the spindle of the machine. The outer end is bored and tapped at (O) as shown, to receive the bar (B) which is threaded right or left hand according to the direction in which it is desired to run the machine.



The bar proper (B) besides being slotted to take the square tool (T), is drilled and tapped in the end to take the two set screws as shown. These set screws are made of tool steel and the points are hardened. It will be noticed that the point of one is turned flat and the other is pointed. The tool itself is countersunk at intervals to fit the nose of the pointed set screw. This allows of a fairly fine lateral adjustment of the tool. To move the tool out a little, the flat screw is loosened and the pointed one screwed down. When the pointed set screw has bottomed, it is only necessary to interchange the screws and the adjustment can be continued for a considerable range. Care is necessary in screwing down the set screws, as very little pressure is necessary to hold the tool firmly, and too much will spoil the threads of the screws.

Question.—What would be the amount of iron required for a certain casting? The pattern, 20 per cent. of which represents cores and prints, is white pine and weighs 15 pounds.

Answer.—$100\ \% - 20\ \% = 80\ \% = \frac{80}{100}$

Ratio of white pine to iron is 13 to 1.

Weight of iron, therefore, is $\frac{80}{100}$ of $15 \times 13 = 156$ pounds approximately.

BORING BAR FOR MILLING MACHINE.

Elements of Power Transmission -- The Belting Feature

By J. Pedie Sanderson, B.A.Sc.

The necessity of a fully competent man to supervise the care of belts is often one of the things about a plant that are so obvious as to be little thought of. Like the engineer who is asked: "Can you start an engine?" and the fireman who is hired for his ability to transfer coal, this man's necessary qualifications are often fulfilled by an affirmative answer to the question: "Can ye fix belts?"

IN spite of the many improvements recently made in electrical transmission and the great advances achieved in other forms of power transmitting mediums, belt drives are still the most suitable for a fairly wide range of conditions, and their apparent simplicity is inclined to cause their popularity to remain with engineers for an indefinite period of time.

The initial cost of a belt transmission is about one-fourth that of an electrical transmission where the conditions are suitable for the former system, but where the drive is such as to cause more or less rapid deterioration of the belt material, the balance of favor goes to the electrical drive. A leather belt drive costs nearly twice as much as a rope drive, and more where large powers are to be handled for considerable distances. Rope drives, however, unless great care is exercised in their construction are very much less economical.

Rope Drive Comparisons.

As the ropes wear they become uneven in diameter and some parts fall more deeply into the V-shaped grooves of the sheaves than others, causing different speeds in different sections of the rope. This sets up a sort of differential drive which causes a difference in rope tension and may even cause some ropes to be tighter on the slack side than on the intended tight side of the drive, and consequently producing negative work. Leather belts can be efficiently spliced much more easily than cotton or rubber belts, and the splicing up of a rope drive is a very considerable undertaking in comparison.

Abuse of Belts.

The value of a belt transmission rests in its durability and efficiency, two qualities almost entirely at the mercy of the treatment which is accorded it. A particular case came to the writer's notice about ten years ago. A three-inch leather belt was placed upon the cone pulley drive of a lathe and, on account of poor alignment and rough usage, had to be replaced with a new one in less than six weeks. Before the new one was put on, however, the pulleys and shafts were correctly lined up with the result that it is still running and rendering good daily service.

The strangest feature in connection with the supervision of belting considering its importance to the continuous and efficient operation of machinery is the fact that, in a great majority of plants, its care is either entrusted to no man in particular, or to some one who has been found to be unsuited for anything else. How often one sees an important drive made up of from three to six pieces of belting of various ages and thicknesses fastened together with leather lacing, wire, and perhaps a number of patent metallic fasteners. The operator in many cases, patches or fixes his belts with whatever he can get, and gives them no further thought as long as his machine keeps going. He rarely has more than a rudimentary knowledge of this class of work.

Belting Organization.

The belting of a plant, no matter how extensive, should be placed in charge of one man, preferably one who has gained his experience in a factory where belts are made, and who with his understudy should in company with others connected with machinery maintenance, be under the direction of the chief engineer or master mechanic. It is only in this way, and seeing that the belt man does his work, that dependable records of belt performances can be kept and efficient systems of inspection be carried out.

Tension Measuring Machines.

By far the most important point in connection with the care of belts is tension properly set and maintained. There have recently been devised and placed on the market several appliances for accurately measuring the tension of belts. One of these is the belt bench which is provided with spring balances and other requisites so that belts can be periodically removed from their machines and be brought to the bench for inspection and repairs, and have their tensions weighed. This is to be advised where the number of belts will warrant the expense, although a great deal can be accomplished by an intelligent man without its use. To supplement the use of the bench, which is limited in its application, there has also been perfected a portable device for measuring the tensions of non-removable belts while in place. As this is applicable only to small belts, and is rather inconvenient to use in some belt situations, it has not, so far, proved very useful.

Proper Tension.

The most suitable tension of a belt is an extremely variable quantity. It should be adapted to its position and to the work required of the belt. The less the tension can be made within reasonable limits without causing slipping, the longer will be the working life of the drive. The experience and judgment of a man suitable for this work has, so far, been found to be the best authority for setting belt tensions.

Belts should be made endless; that is, lapped and cemented together whenever possible. In smaller ones, it is often necessary for convenience in caring for them to have one inferior joint in its length, but there is no excuse for more. This joint should be intelligently made with leather lacing of the proper proportions. Patent metallic fastening devices should be used with caution as a number of them have been found to be worse than useless.

Stretch.

The average leather belt stretches from 6 to 8 per cent. of its original length during its lifetime, and most of this takes place during the first six or eight months of its active use. After this, the stretch is small and uniform until all elasticity is lost.

The method of procedure then for a moderately large belt would be to cut it from a foot to three feet too short, depending upon its size and length. It is then laced up with a carefully made patch which can be periodically shortened until the greater part of the stretching process is finished. A permanent patch is now cemented in and the drive will require attention only at long intervals of time thereafter.

It is well known that a lapped and cemented joint will last more than twice as long as any other, besides running more smoothly and in fact, it can be made as strong as the body of the belt. When the simplicity of making a first-class cemented joint is known it is surprising that it is not more generally used. The requisite tools are comparatively few and inexpensive, as it is possible for an intelligent man to make most of them for himself.

Cementing a Joint.

Before cementing a joint, the belt should be placed over the pulleys and the proper tension obtained by means of

clamps. Care must be observed to fasten tbese clamps squarely across the belt and to locate them centrally witb it before drawing them up with the threaded rods along the sides. After drawing the belt a little tighter than is desired to allow for slack, place a smooth board under it between the rods and bevel the ends to form the lap. Apply the cement while very hot, but not boiling, and not too tbick, rubbing it in thoroughly. On large belts, it is better to cement a few inches at a time, rubbing and hammering each part down by itself, and so proceeding until the joint is completed. The clamps sbould remain in position for at least an bour or as long as convenient. Small and medium-sized belts can be readily clamped witb C clamps between two smooth boards to wbicb they have been tacked in the proper position. The length of the lap sbould vary with the width of the belt, general practice being given in the folowing figures:—

Belt widths in inches....2 3 4 5 6 7 8
Length of lap in inches..5 6 6 7 8 8 9

For widtbs of 9 inches to 18 inches, the lap is made equal to the belt width. Above 18 incbes, the length of the lap need not be greater than this.

Direction of Lap.

The direction of the lap should be such that, in a single belt, the leading edge of the lap should be on the inside or next the pulley. In a double-ply belt, tbe same rule applies with regard to the outer layer. The trailing edge of the inner ply, however, should be next the pulley which gives the joint the form of a broken V with the vertex pointing in the direction in which the belt is intended to travel.

Friction is much greater between similar tban between dissimilar substances, hence much is to be gained by covering pulleys with leather. This allows a greater horse-power to be transmitted without increasing the tension of the belt, as well as to greatly reduce the tension necessary to transmit a given horse-power. To cover a pulley with leatber, make the covering in the form of an endless ring whose circumference is about ⅛ inch to the foot less than the circumference of the pulley. Clean the surfaces of all grease by washing with benzine, naphtba or similar substance. Start the pulley into the ring and cover with a special glue both the inside surface of the ring and the exposed surface of the pulley. Quickly drive the cover over the pulley by lifting it, and striking the cover edges against the bench or floor. When in place, rub the cover thoroughly with a smooth hardwood stick or hammer handle to insure perfect contact, particularly around the edges. If properly done, no pinning is required although it is customary to insert a few copper rivets.

Choice of Belts.

Narrow, thick belts are much more desirable than wide thin ones, especially for long drives. According to Mr. F. W. Taylor, whose experiments cover a continuous period of over nine years, it is advisable to use double belts on pulleys 12 inches or over in diameter and triple belts on pulleys 20 inches or over. This is for the purpose of giving a sufficient stiffness to prevent snapping and waving on the slack side when running at high speeds which is often more injurious than the actual work the belt has to do. This stiffness should also be sufficient to prevent side travel which becomes excessive when belts are long and the load variable.

Belt Calculations.

The satisfaction of belt drives is greatly increased by their proper proportioning.

To find the width of belt necessary when the horse-power required to be transmitted is known.

Multiply the horse-power by 33,000 and divide this product by the product of the belt speed in feet per minute multiplied by 55 for single, 83 for double or 110 for three-ply belts.

The constant 55 depends upon the arc of contact of the belt on the pulley and varies greatly according to different authorities, that is, all the way from 30 to 65. The above, however, is a reliable figure and is for cases where the arc of contact is approximately half of the pulley. When the arc of contact is not 180 degs., the "effective pull" can be found by multiplying the arc of contact by 55 and dividing the product by 180. Multiply this by 1.6 for double belts and by 2 for triple belts.

Inspection.

The belt man should carry out careful and systematic inspections of all belting at frequent intervals and keep a record of his work. Inspection should be such as to determine if any of the following conditions exist:—

(1)—Whether belting is over-dry or saturated with oil.

(2)—If any laps have begun to open.

(3)—Whether belting is working under proper tension.

(4)—Whether shafting is in line or if a guide has to be used to keep belts on the pulleys.

(5)—Whether afflicted with an overdose of dressing.

General.

Greasy or unduly dry belts should be thoroughly cleaned, the former with naphtha or benzine if necessary, and the latter may have to be scraped free of surface dirt. When a clean surface is obtained, both sides should receive a light coat of approved dressing. These applications should be repeated judiciously until that mellow but not greasy feeling characteristic of proper working condition is obtained.

If laps have begun to open, they should first be thoroughly cleaned with some degreasing substance such as naphtha and re-cemented, not tacked or riveted. If shafting be out of line, the sooner it is fixed the better for the machine as well as the belt. The tightness with whicb belts are put on pulleys is of fundamental importance not only to the belt but to the bearings that carry it. Improper tensions should be promptly re-adjusted to the least that will satisfactorily transmit without slipping the full load required of the belt. The use of rosin, soap or even an overdose of good dressing is to be rigorously avoided. If a belt will not do tbe work required of it without sucb destructive encouragement, it should be replaced by one of tbe proper dimensions.

All electric motors, engine drives and the like where large belts are used should be so mounted that the centre to centre distances between the shafts can be adjusted to give the proper tension to the belts, or in cases wbere this cannot be done, an idler pulley should be hung and weighted so that the most suitable belt tension will be constantly maintained.

The labor involved in caring for belts cannot reasonably be placed in the "unproductive" class any more than the capital invested in the belts themselves, for the one is vital to the efficient working of the other. The condition of a belt hanging down and the machine operative waiting for the belt man to turn up is one that could not exist with a properly regulated belt department. This saving alone coupled with the prevention of the loss due to slipping belts, to say nothing of the saving in capital investment, would make it a profitable matter to pay the belt man a very good salary.
